$100, unopened, still in shrink wrap.

A popular case for projects to closely match the Collins S-Line styling.

SAW devices are not that easy. both sides (rx/tx) are built onto the same die usually using vlsi technology.

the frequency of your tx part will depend on the distance/size of your fingers and the frequency with which it is excited. the characteristics of the travelling wave then depends on the filtering properties of the transmitter, the medium it's travelling on and the receiver.

but apart from that i don't quite understand which part you are trying to build.

post again for more information. i currently don't have an email otherwise i'd post it.

Is there a cheaper replacement for this transistor, or something
similar for a power supply pass transistor? It seems I've heard of one.
Thanks for reading.

Hi all,

My name is Alex Wiecek VE3GOP, and I'm a member of the Polish Amateur Radio Club VE3XPL here in Toronto. We are currently trying to establish a listing of all polish speaking Canadian Ham Radio Operators living either in Canada or abroad. The purpose of this activity is to present a petition to the Industry Canada to obtain a temporary special event callsign to commemorate the 75th aniversary of the Polish Ham Radio Society in Poland. We tried contacting the IC office in Ottawa but they don't seem to be responsive and as such, we have decided that the next approach would be to present them with as many e-mail petitions as possible to make our voices heard.

We need your help, if you are a polish speaking amateur or know someone who is, we would like to hear from you.

Please contact me at alexwiecek@home.com, and if you'd like to learn more about our club, please visit
http://web.ionsys.com/~magnum/ve3xpl/index.htm

your help would be greatly appreciated.

Thank you.

73's Alex VE3GOP

Be prepared to double or triple the number of transistors, since the current gain drops (and Vbe increases) quite rapidly if similar load currents are used as with 2N3771, thus the base circuit must be capable of supplying the larger base current demand at a slightly higher voltage. The Vce voltage is also quite large for large currents, so you must be prepared to increase the transformer secondary voltage to compensate for this, but this also increases the power dissipation.

Two 2N3055 transistors are a good replacement for a single 2N3771, but it is your problem how you are going to fit it in the same holes as the single 2N3771 :-).

If you are building the power supply from scratch, then it is a good idea to put a large number of 2N3055s in parallel and keeping the current for each transistor in the 4 .. 6 A range, thus keeping the power dissipation lower for each transistor lower. With adequate heat sinks for each transistors it is possible to keep the junction temperature lower and hence increase reliability, compared to a single 2N3771 running at very high junction temperatures.

3369. Computer Sound Card Output Levels

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-01 14:42:51 UTC
From: wb5agz@dc.cis.okstate.edu
Message-ID: <LZVL5.24$j4.180@news.onenet.net>
Source record: 56946

Is there a wide variation in level between different computer
sound cards or is it a sort of standard?

I am using a Dell Dimension 266 MHZ computer which has a
built-in Yamaha sound system. If I turn the software volume controls
to the max, I get about 25 to 40 millivolts from each channel. The
sound is clear as a bell on both channels (in other words, I think it
is working as it should). I was expecting to see maybe 2 to 3 volts
AC which is what you normally get out of an FM tuner or CD player.
This present level is too hot for a microphone input and too low for a
normal audio amplifier designed to use the line-outs from
entertainment devices. I have plenty of op-amps lying around, etc, so
I can make the output whatever I want, but I was just curious as to
whether this is normal.

If it is not, I had better make it very easy to change the
ratio of the divider resistors in my preamp which I am building. This
is actually going to be kind of an odd device when I am through. I
plan to build the actual preamp part as a stereo amplifier and then
make it possible to feed either or both channels in to a mono amp for
monitoring.

By the way, I called Dell Tech Support who was very nice and
helpful, but they didn't have any specs on output. I asked several
folks in our organization who tinker with computers and they weren't
sure, either. I figure this group is a good place for this kind of
knowledge because a computer sound card is rapidly becoming an
essential part of a ham shack these days.

I think there is some variation on the speaker outputs, but
the 'line out' one would guess to be fairly consistent. My
software has a 20db mic boost...dunno if its really a boost,
or removal of attenuation. I'm awaiting this answer too!

======
Hi Jim -- just an idea. You can print your own on Avery products. They make
them in many colors -- including transparent. I affixed them to a 35mm photo I
took and it becomes a QSL card. For a sample of transparent use see URL:
http://www.qrz.com/database?callsign=ac6v
The AC6V is a transparent label printed on my trusty HP 812C printer. The
reverse side is a large Avery label with the QSl info printed on it.

And Mail box etc can make decals for you as well

If you are Canadian citizens, why don't you celebrate something
Canadian?
Immigrants to Canada never cease to amaze me. It's no wonder our
national pride is going down the toilet. If you ask anyone on an
American street what nationality they are, they answer American. Try
that in Canada, and you never get "I am Canadian". Now, I'm not
pro-American, in fact I really find them quite annoying, but give it a
rest already. If Poland was so great, you know where the door is.

First, thanks to those who wrote responses through the list or
to me in person. While I was writing one answer to a response, it
suddenly hit me as to what may be happening. This is a Linux system
and the sound card is a 16-bit card. All of the samples I was playing
with are 8-bit samples. The Linux sound card driver I am using has a
/dev/dsp which is an 8-bit 8-KHZ sample-rate raw PCM audio device.
The .wav players I have on the system work properly with /dev/dsp and
set the sample rate correctly, but I don't think they make any
adjustment to the samples such as to make sure they occupy the
high-order byte while stuffing 0's in the low 8 bits. I suspect that
the high byte is 0 and the low byte is the 8-bit sample. This would
cause the audio output to be 1/256 of what it should be which is
pretty close to what is actually happening.

I bet if I find a true 16-bit .wav file and play it, it will
be about 25 or 30 DB louder.

If that is the case, I can try to write a program to correct
this problem. It wouldn't even need any brains so to speak, only the
ability to form a 16-bit word with the upper half being the sample and
the lower half being 0's as place-holders.

As to the question about the 20 DB mic boost, it could be
something like that. Just shifting the sample several bits to the
left or from LSB towards MSB will make the sound louder but it won't
add any more resolution. The steps just get bigger.

Source record: 56858

You might want to give some thought to what will happen to the noise and other artifacts that reside in the bottom one or two LSBs of the 8-bit data. If you merely shift the byte to the MSB then all that noise, et all, will be amplified accordingly. The quality of the audio may suffer accordingly.

I would think about maybe truncating or otherwise smoothing the LSB and perhaps the next bit as well and then shifting up the remaining 6 or 7 bits.

Another issue with soundcard speaker outputs is that some of them expect to find a terminating or load resistor in what is plugged into the connector. Absent such, some peculiar things can happen.

Finally, many soundcards will flat-top and otherwise distort the audio signal if the mixer controls are advanced much beyond the 50% point. Such distortion is seldom bothersome on typical cheapy computer speakers. But, with soundcard use as the principal device in PSK31 operation, even small amounts of distortion are unacceptable. I can degrade the IMD of my Kachina 505DSP output signal on PSK31 by merely increasing the WAVE slider from the 1/3 postion to the 1/2 position. With controls set properly, I can obtain -40 db IMD readings in the lab and on the air.

No. If the sound card is configured for 8 bit samples, and you
feed it 8 bit samples, it will do the right thing. Have a look
at, for example, the AD1847 data sheet.

When people describe sound cards as "16 bits", they are not
referring to the sample size. They are instead referring to
the width of the data path between the card and the host system.
Eight-bit cards (i.e. XT bus) are long obsolete. Sixteen-bit
cards (AT/ISA bus) are common. PCI cards can do even better,
with 64 and 128 bits being commonplace. But all with 8 or
16 bit samples.

Two things I'd try: try terminating the line output in the
600 ohm termination for which it was designed. Also, try
another sound card. It wouldn't be the first time one was DOA.

I plug the line output from mine (a cheap Crystal-based card)
into a stereo amplifier I bought at a thrift store and a couple
of Radio Shack speakers. It sounds great!

3382. Re: ? interfacing Kenwood TS790A

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-01 22:00:41 UTC
From: Frontier News <ihi@frontiernet.net>
Message-ID: <8tq3s1$1d8c$1@node17.cwnet.frontiernet.net>
Source record: 56860

Bill,

I have the TS790A and can offer the following:

There are two connectors on the rear that might be useful to you.
The first one is marked EXT CONT (for external control) It is a 7 pin DIN.
Pin 4 is 12TXG. the manual provides the following: "Grounded during
transmission in 1200 MHz band. Normally at high impedance. (Maximum
permissible voltage 20V. Maximum permissible current 10ma."
Pin 1 (43TXG) and pin 6 (14txg) are the same for 430 and 144 respectively.
pin 2 is the external push to talk. transmission starts when the pin is
grounded.
I use the TXG signals to drive a transistor (2N3053) that I bias with 3K to
12V (from ACC4 pin 7) and 50K to ground (from ACC4 pin 2). I use the
transistor to pick the relay in my control box. Works well. If you want
more info on my control box, I would be glad to send it.

The second connector is marked ACC4 (normally used for amateur TV) It is an
8 pin DIN. Pin 4 is called CNT and:"When 5 to 12 v is applied to this
terminal, the transmitter IF signal to the RF unit will be blocked" Pin 7
provides filtered +12v (not to exceed 100ma), and pin 2 is ground. I use
these to insure nothing is transmitted unless the relays I use for switching
in a preamp are picked. I use an 8k resister between pin 7 and 4, and use
the external contacts on my coax relay to apply a ground from pin 2 to pin
4.

For completeness (although I have never used them) the following connectors
are also in the rear. ACC1 is for computer control. ACC2 is for Data
(packet, Amtor, RTTY, SSSTV, etc) and ACC3 is for controlling an external
preamp.

Hope that helps.

I agree, Fred. Unfortunately, I fail to see Allan's point and how it relates to what they're trying to do.

Allan, a lot of the guys in the Toronto group have decided to leave their mother land because of political reasons and ham radio was not something that was going to keep them there - not one of them will metion that "Poland was so great" as you have so intelligently put it. The beauty of this hobby is that they were (and are) able to keep in touch with their buddies accross the pond on a regular basis using ham radio and thus, they'd like to celebrate their roots just like any other person.
Don't get me wrong here, just like every other Canadian they do pay their taxes, they do wear the red poppies on the Rememberance day and they do celebrate the Canada Day with pride.
Unfortunately, there are individuals who still seem to live in the "stone age" thinking that all immigrants ever do is steal our jobs and overpopulate already crowded metropolies. But they seem to forget the fact that immigrants also bring in their expertise and knowledge to make this country better - be it Canada or the United States or any other country for that matter.

I believe the RF Monolithics is the principle manufacturer of SAW
resonators and they have a few application notes on there web sit on the
design of data transmitters and receivers based on their SAW resonators.
An example can be seen at

http://www.rfm.com/corp/appdata/asktrans.pdf

Hi,

I'm looking for a plate xformer to swap for this Hammond 2180.

The specs from Hammond are:

Primary: 15000 ohms CT

Secondary: 5000 / 7000 ohms @ 250 mA MAX.

Freq., response 150-7000 Hz.

It's recommended application was for 811's.

Plate caps already attached.

Will consider any xformer or power supply as swap.

Tnx

John VE3PCN

I'm trying to build a low powered, narrowband one way RF link.
I figure the best way to acheive a narrow bandwidth (and stable
frequency) is to utilise either SAW, or crystal based frequency setting.

I know the theory behind modulation (AM and FM) but I lack the practical
experience of making up oscilators based on SAW or Crystal and
integrating them into the design.

Any assistance/pointers gratefully appreciated

What frequency? Power?

You could use two transistors: one for xtal osc, one for PA.
Could use fsk pulling of the oscillator for modulation, or
keying of the PA, for on/off data.

Source record: 56878

Thank you to everybody who answered my questions and kept me checking everything out. It turns out what I needed was a mixer program. When I installed aumix and turned the volume up to 100% and also turned the dsp input to the mixer up to 100%, I now get a RMS AC voltage of 1.55 or there about. I tried a couple of test sine waves recorded at 100 HZ and 1 KHZ at as close to full volume as I could get without clipping and my output seems to sit at 1.5X AC volts. That would be a bit over 2 volts peak so I think I have it working properly.

The mixer program shows that the power-up defaults for all the settings are around 50% for the DSP and mic and 33% for the synthesizer.

If one is only interested in playing the DSP output, then it is safe to turn it up. I imagine the reason for the low defaults is to play it safe and be sure there is enough dynamic range in the output stages to handle several audio sources all feeding in at once.

Anyway, the audio is now loud as well as clear. I am amazed at how good 8-KHZ sampling sounds on signals recorded off of a communications receiver. Music from an FM radio is pretty sorry with an upper limit of 4 KHZ, but stuff recorded from short wave such as a few seconds of WWV, etc, sound little different than the original.

Hello All,

I have a very nice Radio Shack general coverage table top receiver for sale
. Receives AM, USB, LSB and CW on all bands thru 30MHZ. I have a very
accurate calibration chart that goes with it. It is missing the upper dial
red line pointer (available from RS.) it just snaps in. Nice little
receiver. Pix available on request. Get it before it goes to ebay.

Asking $60.00 plus shipping

Hi,
I wonder if anyone out there has a datasheet or any info about
a chip with the following markings.

F 87001A
9009 M89

It's probably the synthesiser chip from an >10 year old NMT cellular radio.
Searching various chip search engines on the web found me nothing.
Also searching Fujitsu and Fairchild sites found nothing.

It all sounds pretty good to me - but maybe that's because my hearing is some
12Db down at 4.5Khz now. :-) Actually, if you minimize sampling artifacts by
proper pre-filtering, 8Khz sampling sounds quite acceptable.

There's an outfit that used to advertise heavily in ham
magazines that has these. I don't have any current mags to
check, tho. I recall the name was RF Parts, Inc. I got
output transistors for my Icom thru them.

From: paul <apollo_six@nospambtinternet.com>
Message-ID: <549WAiArYWB6Ew9p@btinternet.com>
Source record: 56800

Parmeko HT transformer for sale.

110 or 240 volts input, centre tap bi phase output at 2.5, 3, or 3.5KV per leg @ 248Ma.

Possible DC output voltages 3.5KV, 4.3KV or 5KV at 248 Milliamperes after capacitor smoothing.

The transformer weighs 80 lbs, is oil filled, with ceramic insulators, an interwinding screen and is the biggest Parmeko make. Current price new is GBP 2000 plus.

It comes fitted into am aluminium sub chassis complete with 110 volt control relays and Ferranti HS32 high voltage rectifier diodes.

Owing to the weight, as it is a 2 man lift, any buyer will have to collect from South Wales (UK).

Paul

If you keep the deviation low the receiver will pick up the noisy
signal. With higher deviation the receiver will just pick up noise.
With still higher deviation the receiver will pick up noise, but
at a reduced level.

The KBPC was an extremely common bridge family offered by Diodes, Inc.
and other vendors.

KBPC15 was the 15 Amp family. KBPC1501/KBPC15-01 was a 100 Volt
device.

Diodes, Inc. (see www.diodes.com) has moved customers to a glass
passivated alternate product family, the GBPC family. Numeric
portions of the part number is identical (ie; GBPC1501 = 15 Amp, 100
Volt).

General Semiconductor (formerly GI) (See www.generalsemiconductor.com)
and other vendors offer a similar product. In GS's case, they offer
the identical part numbered product.

The GPBC family should be readily available from all of the Diodes,
Inc. and General Semiconductor distributors.

Can use higher voltage units as replacements 1502=200V, 1504=400V,
1506=600V, 1508=800V, 1510=1000V

regards - greg

3427. Replacement for MRF475 and MRF476

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-05 00:00:00 UTC
From: Curtis Scholl <cscholl@izzy.net>
Message-ID: <3A061157.ECE26783@izzy.net>
Source record: 56807

Hi Folks:

Anyone out there got a reference for the Motorola MRF475 and MRF476 RF
Transistors?
Thanks in advance!

Curtis Scholl
cscholl@izzy.net

3428. Marconi 2022E Signal Generator

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-05 00:00:00 UTC
From: Joe McElvenney <joemac@xic.demon.co.uk>
Message-ID: <VA.000000fd.05d19de6@xic.demon.co.uk>
Source record: 56808

Hello,

Does anyone know of a likely source for a maintenance manual
for a Marconi 2022E signal generator. I have tried a number of
sites but haven't come up with anything. The present owners of
Marconi Instruments promised to get back to me but haven't done
so.

The instrument has a large offset error (10MHz or so) below
62.5MHz where the signal is derived from the mixing of a 160MHz
loop with a synthesised signal from the main generator. From
62.5mHz up to 1.01GHz, it is fine.

Any help would be appreciated.

73 de Joe, G3LLV

White noise has an infinite spectrum so the answer is no, you can't squeeze white noise into the bandwidth of a receiver. Perhaps if you were more specific it might be possible to give the answer you seek.

Cross-posted to: alt.ham-radio.marketplace,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.swap

When I lived up north it was easy to find a ground for my rigs through the plumbing pipes, etc. Here in Florida however, almost everything is PVC. Here's my plan: I intend to run transmission line into the house through the wall near the station location. There will be a lightening arrestor in the line from the mast mounted vertical. (ten meter vertical, about twenty feet high, I'm starting slow.) It will be adjacent to the transmission line entrance point, connected to an 8 or 9 ft. ground rod. From the ground buss in the shack, I intend to run a bare ground wire through the line access point out to be connected to the same ground rod used for the lightening arrestor.Any comments or suggestions will be appreciated.
Thanks and 73, Jim W2JBS

Being in Florida, the best advice I can add is to set things
up where you can readily DISCONNECT the antenna and and PULL
the ac power physically. Having a good ground is a mixed
blessing if a lightning surge comes in via the power. It'll
jump right thru your gear to get to that nice ground.
Oh, and pull ur telco/modem connection too when a storm is
in the area.

Just tuning the receiver (in AM mode) to any frequency with no signals present should be about as close to a white noise approximation as anything you can find.

Hello Kreso,

the best articles about H.F. amplifiers could be find in Radio Handbook by Orr, W6SAI.
Regarding the Philips tetrodes, some of the guys in Slovenia have had used them as triodes in amplifiers like Kenwood Tl922 or heathkit SB220.(cheap replacement!)
generally speaking the same tube could be used as triode also on 50 MHz, although I could not guarantee that the interelectrode capacities will make it operational. Also you can run the tetrode being rf grounded and provide the same effect as dc grounded. In case you would not get any responses drop me an e-mail I could help you with several schematics of 3-500z and 4-1000a for 50 MHz.
Good luck, Nermin S58DX

Well, not actually . . .

Since there is no such thing as "infinite spectrum" the definition below leads to the conclusion that there is no such thing as white noise.

And that is not a true statement.

In the real world, electronic devices and systems have finite bandwidths. And noise energy which posses a uniform power density spectrum within a specified bandwidth is certainly qualified to be termed "white noise."

To carry things a little further, you will find the power density spectrum of noise in the output of an FM receiver to be termed "pink noise" due to the nature of the spectral density vs frequency.

So, the search for "white noise" need not be abandoned. But, what you use for "white noise" does have to be qualified in the context of your intended application.

I'm not a hundred percent sure what frequency to use.
I expected to be able to dabble in the RC frequencies (27 and 40 MHz) or
in the cordless phone low power RF link freqs up around 300-400
MHz.(DOTC will no doubt tell me what I cana nd can't do)
as for power... quite small. I expect the transmission distance to be in
the order of 2-500 m line of sight in most cases using a simple antenna.
Wher I need greater distances (beacon mode) I'll be using a highly
directional yagi for RDF.

3464. Q: Moto MSF5000 repeater for ham use

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-07 00:00:00 UTC
From: tswisher@gcfn.org
Message-ID: <8ua27o$pe5$1@acme.gcfn.org>
Source record: 56704

Anybody out there used a Motorola MSF5000 CXB-series (digital capable) UHF repeater for the UHF ham band?

1. Will it go into the UHF ham band (specifically, a 444 tx/449 rx split)?
2. If so, are there any modifications necessary?
3. Does the RSS support programming into the ham band, or is one of the clever little tricks like holding the shift key down while typing the frequency necessary?
4. Any other handy hints?

Thanks,

Tom WA8PYR

I've built Fritz Raab's '700w CW PA on 160m for under 10 USD' with a
pair of IRF FET's in Class-E but after my engineer colleague contacted
him via E-mail, he was told that while they had designed an AM modulator
they have never published details.

In fact, Peter G3YYN pointed out some mistakes in Fritz's calculations
which he later acknowledged.

This leaves us out in the cold and starting from scratch on the
modulator front.

Any chance of scanning that Class-D article?

From: leeann tweeden <leeanntweeden@MailAndNews.com>
Message-ID: <3A1A90AB@MailAndNews.com>
Source record: 56840

Is it possible to use old transformer cores for the construction of filter chokes?
I have access to many transformers used on HVAC equipment and many of these have cores that can be taken apart easily as they are not welded.
I have checked the windings using a meter with an inductance feature and while
the values range in the 1-4 Henry range which is too small for my project, I feel that I could strip off the old pri and sec windings and wind a new bobbin
of appropriate turns???
The cores I would be using are e i and non interleaved and from my reading this is what I need for a good choke as the gap may need to be adjusted. I am
not looking for perfection as this is just for a hobby project.
I would like to build a tube rectified power supply for some tube regens I am
working on and all the schematics I have found make use of inductors for filtering.
I have limited reading material on the subject and I can not find a lot of info pn the subject via the internet.Any comments suggestions links etcetera will be deeply and sincerly appreciated. thanks

I doubt it, for power supply filters the gap is not necessary.

> I am not looking for perfection as this is just for a hobby project.

Read an old ARRL radi amateur's handbook on the choke filter.
It offers good working solutions for your design.

Hello Jim:

My advise to you is make sure you connect you grounding system to the main electrical service panel ground as per the National Electrical Code. In addition, use multiple points (several ground rods) all connected in series with your station ground which ultimately connects to your electrical service panel ground as well. My QTH is subject to lightning hits (Ive lost computers, tv's, well pumps, electric g-door openers and the like) and this is the only system Ive found that minimizes damage. Of course, nothing can stop damage from a direct lightning hit however one can try to prevent the resulting damage. Also try visiting www.polyphaser.com and look up the essay on "Multiple Point Grounds".

I hope this helps.

3472. AD9854 Software

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-07 00:00:00 UTC
From: richardh@iinet.net.au
Message-ID: <3a080511.26996534@news.m.iinet.net.au>
Source record: 56844

Gday All
Anyone used the AD9854 quadrature DDS chip?
I have built a board and controller but for the life of me cant get the beast to fire up. The startup code is reasonably complicated so maybe I am missing a step. The datasheet is a bit fragmented when it comes to describing the software.
I am using the serial interface

Esssentially my code so far resets the device, resets the serial interface, writes a contol word (4 bytes to location 7), the n writes a FREQ1 word (6 Bytes) and then an IO update

Anyone got any ideas?
Thanks in advance

Richard

Message-ID: <t0g8edivp2hoe4@corp.supernews.com>
Source record: 56845
Cross-posted to: alt.ham-radio.mods,alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Are there any alternatives for a Mic extension cable for the IC-207H other than purchasing the OPC440 ($86) or OPC647 ($55) from Icom??? It seems to me that there must be a way to make this cable a lot cheaper than this- especially when I only need about a 3' extension... Any information regarding sources for the "special" shielded cable and RJ-45 connectors would be appreciated.

If all else fails, I suppose that I'll have to "bite the bullet" and pay the inflated prices... It seems that they really have me by the b***s!!!! If I don't extend the cable, the tension of pulling on the Mic (radio is just below the driver's seat) will eventually cause the cable to separate from the connector and I'll have to replace the connector (or cable) anyway.

73's.

I'd guess 50-100mW would be ok then, with a frequency between
27->300MHz. Don't know much about what free ism bands there are.
I guess on-off pulsing is all thats needed to know its your signal.
2-3 transistors, crystal, and 555 should do the job.

Hi all,

I've been reading this group for some months but this is my first posting. Last year I bought a sack full of cordless telephone base units which have an LA1185 and an MC3359 in the receiver. The LA chip is single-in-line device and is the receiver front-end. There's a crystal connected to it and it evidently mixes the incoming signal at 49MHz down to the IF at 10.7MHz. Can anyone help with info on the LA1185? My Internet searches haven't come up with anything. Thanks in advance.

3482. remembering the IMR54 receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-08 00:00:00 UTC
From: ZL4PY <ZL4PY@mail.com>
Message-ID: <3a0935a9@clear.net.nz>
Source record: 56712

Does anyone remember a general coverage valve 10Khz-30MHz receiver called an IMR54 ? That would be 30-40 years ago now. It was made by a small London based company in competition with Marconi.

I used one of these for many years in marine radio as a secondary backup receiver. It received all modes and I used it primarily on VLF 15KHz. But it was so good for ssb and cw generally that I was often using it by preference in relaying HF traffic for much more modern solid state installations under very difficult conditions. It really had quite amazing performance and I had a selection of the best receivers to compare it with. Maybe it was the valves in the front end which gave it the edge. It could pull small signals out of hash when no-one else could read them.

I recall especially the complex gearing which moved the entire bank of IFT's tuned circuits apart to control bandwith from 5KHz to 100Hz. It was so smooth and friendly to operate.

I guess they are all long gone now. Did anyone ever rescue one of them?

3483. EMAIL PROCESSORS WANTED

#1 - VERY BRIEF INTRODUCTION

Due to an enormous client list, I can only take serious applicants at this time. I am offering a full or part-time position in processing e-mail. You can work at home. I do require that you have a computer and are familiar with internet/e-mail functions. As to the salary it's totally up to you. You will be running your own business, the sky is the limit. What you will see represents a totally legal money making business that anyone can generate a significant residual income.

You will receive full instructions, and I will always be available to help you and answer your questions. This is a genuine home business. This is not a chain letter, money game, telecom scheme, or any of the multitudes of dubious "business" offers that come through your e-mail box. This business will generate a residual income of $2,000 to $6,000 every month with only part-time commitment (about 10 hours a week).

A full time commitment (about 30 hours a week) based on statistics gathered from associates world wide, will translate into an income of $10,000 or more per month!

To prove my confidence and sincerity in this opportunity, there is NO CHARGE to join us for the first month. You will receive all information to get started plus the first month's information package ($90 value). If by remote chance you are not satisfied with the program after the first month and want to discontinue, you may by all means do so and I will not contact you again.

But on the other hand, if you are satisfied with the program and wish to continue after the first month, that is when you have to pay $90 for the next month's information package. Since you DO NOT pay anything until after you are already earning an incredible residual income, you have absolutely nothing to lose.

IMPORTANT!

If the above opportunity interests you in the least, and you would like more specific information about our business please contact me at adenby@consultant.com and type in the SUBJECT LINE: "FORWARD PROJECT 21 INFO". Insert your full name, your correct e-mail address, and any specific questions you may have at this time in the body of the message.

We are successful only if YOU are successful, and therefore we will do everything in our power to ensure that your relationship with us is a profitable and successful one. I look forward to your response.

Sincerely,
Angela Denby

Until quite recently, we used to use the same trick in a radio astronomy
lab, except we wanted a 59.836 Hz signal to drive clocks and chart recorders
at a sidereal rate. The timebase was an OCXO rather than a 555, but we still
used a 60/sidereal second filtered square wave to drive a McIntosh audio
amp. Not how I'd do it from scratch nowadays, but it worked well for 30
odd years.

>> > this. :(

A clean square wave should have about 80% of the power in the first
fundamental (neglecting the DC component, if any.) This should be
plenty to keep most motors happy, especially since there should be
no even harmonics. It sounds like you don't have a clean square wave
and are getting ringing (i.e. extra higher-order harmonics) or
asymmetry (even order harmonics.) You need to filter your switched
signal.

A symmetric triangle wave has about 98% of the power in the fundamental
and no even harmonics (that nice 1/n^2 coefficient in the expansion
helps a lot). You might want to look for a triangle wave oscillator
circuit to replace your square-wave switch (although most of these
designs are, in effect, filtered square waves.)

ZL4PY's comment about feedback is very good. The oscillator circuit
will see the motor's input impedance, through the transformer, as its
output impedance, and this will vary with motor load. A passive filter
circuit may perform poorly with this variable load, and even if it
suppresses the high-order harmonics well, is liable to give variable
output voltages.

>odd years.

I used to work someplace where we needed to drive a stepper motor
mounted on an animation (movie) camera. Instead of building our own
controller, we bought a packaged one from RFX. It was a microstepping
type drive that gave nice smooth motion. Looking inside, there was
a custom board that talked RS-232 to the computer controlling the whole
setup and produced two approximate sine waves 90 degrees apart. These
two signals were then sent to the two channels of a MOSFET-output
stereo audio amplifier. The amplifier was modified to provide current
rather than voltage feedback, but otherwise seemed unchanged. It all
worked very well.

The only weird thing I remember about the design was that it had
three DACs. It seems that the board used unipolar DACs, so their
outputs couldn't be symmetric about ground. Instead, the two sine wave
drive signals were AC coupled through capacitors to provide bipolar
signals to the amplifier. This now meant that these two signals
couldn't command DC holding current for the motor when it was stopped,
so the third DAC was DC coupled to the amp to control holding current.
This in turn meant that the holding current was always the same
polarity on the same phase(s), so it could only hold at one particular
phase position of the driving waveform.

Bob

Many thanks fo your comments
I have done all you say except check the I/OUD pin and I have the PLL running. Applying a clock increases chip current by about 30 mA - I am using a 12.5 MHz clock multiplied by 15.
The chip draws about 120 mA with this arrangement and the DAC outputs are midrange DC. I will check the I/O status and try without the PLL.

Thanks

Richard

Message=20

A while back, I was browsing these newsgroups, just like you are now,=20
and came across an article similar to this that said you could make=20
thousands of CASH within weeks with only an initial investment of=20
$6.00 plus stamps! So I thought, "Yeah, right, this must be a scam!"=20
But like most of us I was curious and kept reading. It said that if=20
you send $1.00 to each of the 6 names and addresses listed in the=20
article, you could make thousands in a very short period of time. You=20
then place your own name and address at the bottom of the list at #6,=20
and post the article to at least 300 newsgroups. (There are about=20
32,000 of them out there and that's quite a large market pool). No=20
catch, that was it. Even though the investment was a measly $6, I had=20
three questions that needed to be answered before I could get involved=20
in this sort of thing.=20
1. IS THIS REALLY LEGAL?=20
I called a lawyer first. The lawyer was a little sceptical that I would=20

actually make any CASH but he said it WAS LEGAL if I wanted to try it.=20
I told him it sounded a lot like a chain letter but the details of the=20
system (SEE BELOW) actually made it a legitimate legal business.=20
2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them:=20
1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18,=20
h sections1302 NS 1341 of Postal Lottery Laws). This clarifies the=20
program of collecting names and addresses for a mailing list.=20
3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance of=20
getting A LOT of CASH ... a much better chance than buying a lottery=20
ticket!!!=20
So, having these questions answered, I invested EXACTLY $7.92 ... six=20
$1.00 bills and six 32 cent postage stamps ... and boy am I glad I did!=20
Within 7 days, I started getting CASH in the mail! I was shocked! I=20
figured it would end soon and didn't give it another thought. But the=20
CASH continued coming in. In my first week I made between $20 to $30.=20
By the end of the second week I had a made a total of $1,000.00. In the=20
third week I had over $10,000.00 and it was still growing. This is now=20
my fourth week and I have made a total of just over $42,000 and it's=20
still coming in ..... It's certainly worth $6.00 and 6 stamps !!!=20
Also, make sure you print a copy of this article NOW, so you can get=20
the information off of it as you need it. I promise you that if you=20
follow the directions exactly, that you will start making more CASH=20
than you thought possible by doing something so easy!=20
Suggestion: Read this entire message carefully! (print it out or=20
download it.) Follow the simple directions and watch the CASH come in!=20
It's easy. It's legal. And your investment is only $6.00 (plus postage)=20
IMPORTANT: This is NOT a rip-off; it is NOT indecent; it is NOT=20
illegal; and it is virtually no risk - it really works!!!! If all of=20
the following instructions are adhered to, you will receive=20
extraordinary dividends.=20
PLEASE NOTE:=20

Please follow these directions EXACTLY, and $50,000 or more can be=20
yours in 20 to 60 days. This program remains successful because of the=20
honesty and integrity of the participants. Please continue its success=20
by carefully adhering to the instructions. You will now become part of=20
the Mail Order business. In this business your product is not solid and=20
tangible, it's a service. You are in the business of developing Mailing=20
Lists. Many large corporations are happy to pay big bucks for quality=20
lists. However, the CASH made from the mailing lists is secondary to=20
the income which is made from people like you and me asking to be=20
included in that list.=20
Here are the 4 easy steps to success:=20
STEP 1: Get 6 separate pieces of paper and write the following on each=20
piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00=20
bills and place ONE inside EACH of the 6 pieces of paper so the bill=20
will not be seen through the envelope (to prevent thievery). Place one=20
paper in each of the 6 envelopes and seal them. You should now have 6=20
sealed envelopes, each with a piece of paper stating the above phrase,=20
your name and address, and a $1.00 bill. What you are doing is creating=20
a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate=20
service and you are paying for it! Like most of us I was a little=20
skeptical and a little worried about the legal aspects of it all. So I
checked it out with the U.S. Post Office (1-800-725-2161) and they
confirmed that it is indeed legal! Mail the 6 envelopes to the
following addresses:
#1) M. Weber=20
801 Oaklands Dr=20
Round Rock, TX 78681=20
#2) S. Patti=20
1808 Ponderosa St.
Cocoa, Fl.,32926
#3) Gill=20

58 Moross

Mt. Clemens Mi. 48043=20

#4) Ryan Dick

7603 Canyon Dr.

Meridian, ID 83642

#5) Y.S.

2702 A Jenner Dr.

Baltimore, MD 21209

#6) D. Sims

905 Burning Bush Drive

Loganville, GA 30052

step 2: Now take the #1 name off the list that you see above, move the =
other=20

names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number =
6 on=20

the list.

STEP 3: Change anything you need to, but try to keep this article as=20

close to original as possible. Now, post your amended article to at=20

least 300 newsgroups. (I think there are close to 32,000 groups) All=20

you need is 300, but remember, the more you post, the more CASH you=20

make! This is perfectly legal! If you have any doubts, refer to 18=20

Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these=20

steps for yourself and, whenever you need CASH, you can use it again,=20

and again.=20

PLEASE REMEMBER that this program remains successful because of the=20

honesty and integrity of the participants and by their carefully=20

adhering to the directions. Look at it this way. If you are a person=20

of integrity, the program will continue and the CASH that so many=20

others have received will come your way.=20

NOTE: You may want to retain every name and address sent to you,=20

either on a computer or hard copy and keep the notes people send you.=20

This VERIFIES that you are truly providing a service. (Also, it might=20
be a good idea to wrap the $1 bill in dark paper to reduce the risk of=20
mail theft.) So, as each post is downloaded and the directions=20
carefully followed, six members will be reimbursed for their=20
participation as a List Developer with one dollar each. Your name will=20
move up the list geometrically so that when your name reaches the #1=20
position you will be receiving thousands of CASH in CASH!!! What an=20
opportunity for only $6.00 ($1.00 for each of the first six people=20
listed above) Send it now, add your own name to the list and you're in=20
business!=20
---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS=20
Step 1) You do not need to re-type this entire letter to do your own=20
posting. Simply put your cursor at the beginning of this letter and=20
drag your cursor to the bottom of this letter, and select 'copy' from=20
the edit menu. This will copy the entire letter into the computer's=20
memory.=20
Step 2) Open a blank 'notepad' file and place your cursor at the top=20
of the blank page. From the 'edit' menu select 'paste'. This will paste=20
a copy of the letter into notepad so that you can add your name to the=20
list.=20
Step 3) Save your new notepad file as a .txt file. If you want to do=20
your postings in different settings, you'll always have this file to=20
go back to.=20
Step 4) Use Netscape or Internet explorer and try searching for=20
various newsgroups (on-line forums, message boards, chat sites,=20
discussions.)=20
Step 5) Visit these message boards and post this article as a new=20
message by highlighting the text of this letter and selecting paste=20
from the edit menu. Fill in the Subject, this will be the header=20
that everyone sees as they scroll through the list of postings in a=20
particular group, click the post message button.=20

You're done with your first one! Congratulations...THAT'S IT! All you=20
have to do is jump to different newsgroups and post away, after you=20
get the hang of it, it will take about 30 seconds for each newsgroup!=20
**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE=20
MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A=20
minimum of 300**
That's it! You will begin receiving CASH from around the world within=20
days! You may eventually want to rent a P.O.Box due to the large=20
amount of mail you will receive. If you wish to stay anonymous, you=20
can invent a name to use, as long as the postman will deliver it.=20
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.=20
Now the WHY part:=20
Out of 300 postings, say I receive only 7 replies (a very low example).=20
So then I made $7.00 with my name at #6 on the letter. Now, each of the=20
7 persons who just sent me $1.00 make the MINIMUM 300 postings, each=20
with my name at #5 and only 7 persons respond to each of the 7 original=20
7, that is another $49.00 for me, now those 49 each make 300 MINIMUM=20
posts with my name at #4 and only 7 replies each, I will bring in an=20
additional $343.00! Now, those 343 persons turn around and post the=20
MINIMUM 300 with my name at #3 and only receive 7 replies each, I will=20
make an additional $2401.00! OK, now here is the fun part, each of=20
those 2401 persons post a MINIMUM 300 letters with my name at #2 and=20
they each only receive 7 replies, that just made me $16,807.00!!!=20
Those 16807 persons will all deliver this message to 300 newsgroups=20
with my name at #1 and if still 7 persons per 300 Newsgroups react I=20
will receive $117,649.00! With an original investment of only $6.00!=20
And some stamps. AMAZING! When your name is no longer on the list, you=20
just take the latest posting in the newsgroups, and send out another=20
$6.00 to names on the list, putting your name at number 6 again. And=20
start posting again. The thing to remember is: do you realize that=20
thousands of people all over the world are joining the internet and=20

reading these articles everyday? JUST LIKE YOU are now!! So, can you=20
afford $6.00 and see if it really works?? I think so...=20
People have said, "what if the plan is played out and no one sends you=20
the CASH? So what! What are the chances of that happening when there=20
are tons of new honest users and new honest people who are joining the=20
internet and newsgroups everyday and are willing to give it a try?=20
Estimates are at 20,000 to 50,000 new users, every day, with thousands=20
of those joining the actual internet.=20
Remember, play FAIRLY and HONESTLY and this will really work.=20
** By the way, if you try to deceive people by posting the messages=20
with your name in the list and not sending the CASH to the rest of the=20
people already on the list, you will NOT get as much. Someone I talked=20
to knew someone who did that and he only made about $150.00, and that's=20
after seven or eight weeks! Then he sent the 6 $1.00 bills, people=20
added him to their lists, and in 4-5 weeks he had over $10k.=20
This is the fairest and most honest way I have ever seen to share the=20
wealth of the world without costing anything but our time!!! You also=20
may want to buy mailing and e-mail lists for future CASH. Make sure=20
you print this article out RIGHT NOW! Also, try to keep a list of every=20
one that sends you CASH and always keep an eye on the newsgroups to=20
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST=20
POLICY. You don't need to cheat the basic idea to make the CASH!! GOOD=20
LUCK to all and please play fairly and reap the huge rewards from this,=20
which is tons of extra CASH.=20
Please remember to declare your extra income. Thanks once again...=20
"People have asked me if this is really legal. Well, it is! You are=20
using the Internet to advertise your business. What is that business?=20
You are creating a mailing list of people who are interested in home=20
based computer and online business and methods of generating income at=20
home. Remember, people send you a small fee to be added to your mailing=20
list. It is legal. what will you do with your list of thousands of=20

names?=20

That's up to you." So, build your mailing list, keep good accounts,=20

declare the income and pay your taxes. By doing this you prove your=20

business intentions. Keep an eye on the newsgroups and when the cash=20

has stopped coming (that means your name is no longer on the list),=20

you just take the latest posting at the newsgroups, send another $6.00=20

to the names stated on the list, make your corrections (put your name=20

at #6) and start posting again.=20

NOTES:=20

*1. In some countries, the export of the country's exchange is illegal.=20

But you can get the license to do this from the post office, explaining=20

the above statements (that you have an online business, etc. You may=20

have to pay an extra tax, but that's OK, the amount of the incoming=20

CASH is HUGE! And as I said, a few countries have that restriction.=20

*2. You may want to buy mailing and e-mail lists for future CASH. (Or=20

Database or Spreadsheet software.)=20

*3. If you're really not sure or still think this can't be for real,=20

please print a copy of this article and give it to someone who really=20

needs the CASH, and see what happens.=20

*4. You will start getting responses within 1-2 weeks, it depends.=20

ALSO REMEMBER=20

SEND YOUR $1 OUT TO EVERYONE ON THE LIST,=20

EVEN IF THEY ARE NOT FROM THE U.S.=20

WHAT ARE YOU WAITING FOR???=20

$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!=20

GOOD LUCK!!!=20

Message

A while back, I was browsing these newsgroups, just like you are now, =

and came across an article similar to this that said you could make =

thousands of CASH within weeks with only an initial investment of =

$6.00 plus stamps! So I thought, "Yeah, right, this must be a scam!" =

But like most of us I was curious and kept reading. It said that if =

you send $1.00 to each of the 6 names and addresses listed in the =

article, you could make thousands in a very short period of time. You =

then place your own name and address at the bottom of the list at #6, =

and post the article to at least 300 newsgroups. (There are about =

32,000 of them out there and that's quite a large market pool). No =

catch, that was it. Even though the investment was a measly $6, I had =

three questions that needed to be answered before I could get =
involved

in this sort of thing.

1. IS THIS REALLY LEGAL?

I called a lawyer first. The lawyer was a little sceptical that I =
would

actually make any CASH but he said it WAS LEGAL if I wanted to try =
it.

I told him it sounded a lot like a chain letter but the details of =
the

system (SEE BELOW) actually made it a legitimate legal business.

2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them: =

1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18, =

h sections1302 NS 1341 of Postal Lottery Laws). This clarifies the =

program of collecting names and addresses for a mailing list.

3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance =
of

getting A LOT of CASH ... a much better chance than buying a lottery =

ticket!!!

So, having these questions answered, I invested EXACTLY $7.92 ... six =

$1.00 bills and six 32 cent postage stamps ... and boy am I glad I =
did!

Within 7 days, I started getting CASH in the mail! I was shocked! I =

figured it would end soon and didn't give it another thought. But the =

CASH continued coming in. In my first week I made between $20 to $30. =

By the end of the second week I had a made a total of $1,000.00. In =
the

third week I had over $10,000.00 and it was still growing. This is =
now

my fourth week and I have made a total of just over $42,000 and it's =

still coming in ..... It's certainly worth $6.00 and 6 stamps !!! =

Also, make sure you print a copy of this article NOW, so you can get =

the information off of it as you need it. I promise you that if you =

follow the directions exactly, that you will start making more CASH =

than you thought possible by doing something so easy!

Suggestion: Read this entire message carefully! (print it out or

download it.) Follow the simple directions and watch the CASH come =
in!

It's easy. It's legal. And your investment is only $6.00 (plus =
postage)

IMPORTANT: This is NOT a rip-off; it is NOT indecent; it is NOT

illegal; and it is virtually no risk - it really works!!!! If all of =

the following instructions are adhered to, you will receive

extraordinary dividends.

PLEASE NOTE:

Please follow these directions EXACTLY, and $50,000 or more can be =

yours in 20 to 60 days. This program remains successful because of =
the

honesty and integrity of the participants. Please continue its =
success

by carefully adhering to the instructions. You will now become part =
of

the Mail Order business. In this business your product is not solid =
and

tangible, it's a service. You are in the business of developing =
Mailing

Lists. Many large corporations are happy to pay big bucks for quality =

lists. However, the CASH made from the mailing lists is secondary to =

the income which is made from people like you and me asking to be =

included in that list.

Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on =
each

piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US =
$1.00

bills and place ONE inside EACH of the 6 pieces of paper so the bill =

will not be seen through the envelope (to prevent thievery). Place =
one

paper in each of the 6 envelopes and seal them. You should now have 6 =

sealed envelopes, each with a piece of paper stating the above =
phrase,

your name and address, and a $1.00 bill. What you are doing is =
creating

a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate =

service and you are paying for it! Like most of us I was a little =

skeptical and a little worried about the legal aspects of it all. So =
I

checked it out with the U.S. Post Office (1-800-725-2161) and =
they

confirmed that it is indeed legal! Mail the 6 envelopes to the

following addresses:

#1) M. Weber

801 Oaklands Dr

Round Rock, TX 78681

#2) S. Patti

1808 Ponderosa St.

Cocoa, Fl.,32926

#3) Gill

58 Moross

Mt. Clemens Mi. 48043

#4) Ryan Dick

7603 Canyon Dr.

Meridian, ID 83642

#5) Y.S.

2702 A Jenner Dr.

Baltimore, MD 21209

#6) D. Sims

905 Burning Bush Drive

Loganville, GA 30052

step 2: Now take the #1 name off the list that you see above, move = the other=20

names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as = number 6 on=20

the list.

STEP 3: Change anything you need to, but try to keep this article as =

close to original as possible. Now, post your amended article to at =

least 300 newsgroups. (I think there are close to 32,000 groups) All =

you need is 300, but remember, the more you post, the more CASH you =

make! This is perfectly legal! If you have any doubts, refer to 18 =

Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these =

steps for yourself and, whenever you need CASH, you can use it again, =

and again.

PLEASE REMEMBER that this program remains successful because of the =

honesty and integrity of the participants and by their carefully

adhering to the directions. Look at it this way. If you are a person =

of integrity, the program will continue and the CASH that so many =

others have received will come your way.

NOTE: You may want to retain every name and address sent to you,

either on a computer or hard copy and keep the notes people send you. =

This VERIFIES that you are truly providing a service. (Also, it might =

be a good idea to wrap the $1 bill in dark paper to reduce the risk =
of

mail theft.) So, as each post is downloaded and the directions

carefully followed, six members will be reimbursed for their

participation as a List Developer with one dollar each. Your name =
will

move up the list geometrically so that when your name reaches the #1 =

position you will be receiving thousands of CASH in CASH!!! What an =

opportunity for only $6.00 ($1.00 for each of the first six people =

listed above) Send it now, add your own name to the list and you're =
in

business!

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own =

posting. Simply put your cursor at the beginning of this letter and =

drag your cursor to the bottom of this letter, and select 'copy' from =

the edit menu. This will copy the entire letter into the computer's =

memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top =

of the blank page. From the 'edit' menu select 'paste'. This will =
paste

a copy of the letter into notepad so that you can add your name to =
the

list.

Step 3) Save your new notepad file as a .txt file. If you want to do =

your postings in different settings, you'll always have this file to =

go back to.

Step 4) Use Netscape or Internet explorer and try searching for

various newsgroups (on-line forums, message boards, chat sites,

discussions.)

Step 5) Visit these message boards and post this article as a new =

message by highlighting the text of this letter and selecting paste =

from the edit menu. Fill in the Subject, this will be the header

that everyone sees as they scroll through the list of postings in a =

particular group, click the post message button.

You're done with your first one! Congratulations...THAT'S IT! All you =

have to do is jump to different newsgroups and post away, after you =

get the hang of it, it will take about 30 seconds for each newsgroup! =

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE

MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A

minimum of 300**

That's it! You will begin receiving CASH from around the world within =

days! You may eventually want to rent a P.O.Box due to the large

amount of mail you will receive. If you wish to stay anonymous, you =

can invent a name to use, as long as the postman will deliver it. =

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:

Out of 300 postings, say I receive only 7 replies (a very low =
example).

So then I made $7.00 with my name at #6 on the letter. Now, each of =
the

7 persons who just sent me $1.00 make the MINIMUM 300 postings, each =

with my name at #5 and only 7 persons respond to each of the 7 =
original

7, that is another $49.00 for me, now those 49 each make 300 MINIMUM =

posts with my name at #4 and only 7 replies each, I will bring in an =

additional $343.00! Now, those 343 persons turn around and post the =

MINIMUM 300 with my name at #3 and only receive 7 replies each, I =
will

make an additional $2401.00! OK, now here is the fun part, each of =

those 2401 persons post a MINIMUM 300 letters with my name at #2 and =

they each only receive 7 replies, that just made me $16,807.00!!! =

Those 16807 persons will all deliver this message to 300 newsgroups =

with my name at #1 and if still 7 persons per 300 Newsgroups react I =

will receive $117,649.00! With an original investment of only $6.00! =

And some stamps. AMAZING! When your name is no longer on the list, =
you

just take the latest posting in the newsgroups, and send out another =

$6.00 to names on the list, putting your name at number 6 again. And =

start posting again. The thing to remember is: do you realize that =

thousands of people all over the world are joining the internet and =

reading these articles everyday? JUST LIKE YOU are now!! So, can you =

afford $6.00 and see if it really works?? I think so...

People have said, "what if the plan is played out and no one sends =
you

the CASH? So what! What are the chances of that happening when there =

are tons of new honest users and new honest people who are joining =
the

internet and newsgroups everyday and are willing to give it a try? =

Estimates are at 20,000 to 50,000 new users, every day, with =
thousands

of those joining the actual internet.

Remember, play FAIRLY and HONESTLY and this will really work.

** By the way, if you try to deceive people by posting the messages =

with your name in the list and not sending the CASH to the rest of =
the

people already on the list, you will NOT get as much. Someone I =
talked

to knew someone who did that and he only made about $150.00, and =
that's

after seven or eight weeks! Then he sent the 6 $1.00 bills, people =

added him to their lists, and in 4-5 weeks he had over $10k.

This is the fairest and most honest way I have ever seen to share the =

wealth of the world without costing anything but our time!!! You also =

may want to buy mailing and e-mail lists for future CASH. Make sure =

you print this article out RIGHT NOW! Also, try to keep a list of =
every

one that sends you CASH and always keep an eye on the newsgroups to =

make sure everyone is playing fairly. Remember, HONESTY IS THE BEST =

POLICY. You don't need to cheat the basic idea to make the CASH!! =
GOOD

LUCK to all and please play fairly and reap the huge rewards from =
this,

which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again... =

"People have asked me if this is really legal. Well, it is! You are =

using the Internet to advertise your business. What is that business? =

You are creating a mailing list of people who are interested in home =

Ah, OK. Gee, this being a "homebrew" group, I figured you just wanted
a little for a homebrew project. I'd have thought it would be obvious
where to go for production quantities. (Maybe I should have bought the
whole 1000 feet when I had the chance. ;-) I'm curious, what sort of
production is it that you're doing?

Cheers,
Tom

Japan Radio Corporation model CFL-218A (YF455EBF) Crystal Filter. This is a high quality 1.8 kHz bandwith filter for a 455 kHz IF frequency. Works great for SSB or digital modes. The original cost was $129.95. It's in excellent condition, checked out, and guaranteed to work to specs.

Source record: 56740

I'd like to add a bandwidth filter to my little Pixie rig, but I'm not sure if I'm on the right track. I'm wondering if a crystal ladder filter in series with the input to the LM386 is the right approach. I'm thinking that something that gives me about 500 to 600 Hz banwidth would be perfect. Any suggestions?

3 or 4 (at a minimum) pieces of quarter-wave wire attached
to the base/mounting bracket. These could also be segments
of guy wire if you want to mount it up on a pipe above the
roof.
Most any ole wire will suffice.

Richard,

More or less in random order:

1) Check that the i/o update pin switched around so it's an input rather than an output. You can check it with a scope, if there are pulses coming out of the chip then the status word is not getting in.

2) The part does not default to an "output on" mode. There are several status bits you need to turn on to get it running.

3) The frequency control word should be a large integer. Two zeros followed by all ones should give an output at 1/4 the clock frequency. An easy check word is two zeros, 44 ones and then two zeros. Even if you have it backwards it should give an observable output.

4) The bias resistor for the DAC output goes to ground.

5) Start off with sinc filter off, comparator off, pll off, digital on, Q Dac off and get it running. That way it should be pulling < 100 ma as you mess with it.

The process should look like:

Reset the device
Reset the serial interface
Shift in the control register address
Shift in the control words (4 bytes)
Check the i/o update pin - fail if it is still an output
Send an i/o update
Reset the serial interface
Shift in the frequency register address
Shift in the frequency control word
Send an i/o update

Sorry to not be more specific but all my notes are at work ....

Enjoy!

Bob

3519. wanted Antenna Tuner

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-09 06:51:41 UTC
From: w4th@webtv.net
Message-ID: <473-3A0A497D-3@storefull-101.private.bryant.webtv.net>
Source record: 56731

I am looking for one of the following antenna tuners.
1. Dentron MT-3000a or 2000a
2. Heathkit 2060
3. Nye Viking
4. X Match
5. Harris
6. Ameritron ATR-30
7. Pal Star AT-4k
The tuner I am looking for must be able to withstand at least 2kw CW on 160 meters.
It must be able to tune balanced and unbalanced lines, and have a switch for selecting between the balanced or unbalanced antenna to be tuned.
I am not interested in any MFJ junk, or anything along those lines. I am not interested in any tuner that wont tune 160 meters. I am not interested in a tuner that has been hit by lightning or has signs of flashover inside the cabinet.
The tuner must be clean and in good working condition.
Thanks for your time and 73
Tom

Ive recently heard that a company was packaging a kit for converting the 10 meter tank circuit of a Heathkit SB-220 for 6 meter use. Does anyone know where this kit can be acquired and what the cost is? Is this modification a difficult task without purchasing a kit?

Thanks and 73

PS: Happy Veterans Day to all who served. Your efforts will never be forgotten.

Move the whip as close as reasonably possible to an electrical outlet and use the third (ground) wire as your radial system. Admittedly, it is somewhat of a random thing, but by the time you get the half-mile of ground wire inside your house, with capacitive coupling to everything electrical that you own, down into the service feeder, and out to the pig on the pole, you've got a fairly decent ground system.

Actually, I've found WD-40 to be great on any kind of switch, relay, or sliding contacts, including variable resistors and capacitors. I've never seen a case where the contact didn't penetrate the film of WD-40 and make a good connection. In one case where I had an open frame relay with contacts grody enough that I could easily measure the contact resistance, the contact resistance improved considerably after spraying with WD-40.

The Pixie is a little xtal based fixed frequency, 2 transistor, 1 IC
rig. It looks like this:

http://www.qsl.net/we6w/projects/pixie2.gif

The location I was talking about is in the audio path. The other
configuration that I've seen for these is a notch filter made from a 741
op amp, and I guess that's the way to go.

Tnx.

DSE have a kit which does this. I bought one and built it. Simple to construct and works well up to 500MHz. If their stores run the same way in Oz as here then you can go and get a copy of the schematic for the asking from the constructors manual of kitsets they keep at the kitset shelves.

Hey Paul,
Most six meter rigs start with an 8.333 Mhz (+ / -) base line
oscillator which triples to 25 Mhz (24.999) and then to either a doubler
to 50 Mhz on to the final or some times even doubles in the final (the
old Hallicrafters HT-40)
You really don't want to double in the final with side band as it will
cause distortion. If you use
crystal control, start with an 8 mhz crystal instead of a 7 Mhz crystal.
Using a grid dip meter for accuracy, remove about half of the windings
of the driver tank, and retune that section for 'Q' at 50 Mhz. The
oscillator will need to be retuned slightly too. Your driver
is probably getting 14 Mhz from the osc. and
doubling to 28 Mhz.....So by using an 8.35 Mhz xtal, the osc will run at
16.7 Mhz (tank will swing 2.7 Mhz easily) the the driver will act as a
tripler with an output at 50.1 Mhz . You may have to play with some of
the bias voltages for
proper drive to your final, but the most expensive thing will probably
be the six dollar crystal. If your using VFO control, the same rules
apply, except you will have to do the math to change the value of the
crystal in the VFO heterodyne circuit to make the dial calibration track
(28.0 =50.0 , 28.1=50.1 , 28.3=50.3 etc.)
Have fun !

3541. Re: Crystal filter for Pixie?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-10 00:25:20 UTC
From: James Horn <jimhorn@svn.net>
Message-ID: <3a0b3fd9@news.svn.net>
Source record: 56747

I'm not familiar with your rig, but an LM386 is an audio amplifier, implying that the location you mention is in the *audio* signal path. A crystal filter needs to go in a fixed tuned higher frequency path - either the RF path (if it's a fixed tuned receiver - unlikely) or the IF (99.9% usage is here).

An audio crystal filter is conceivable but the crystals would be huge (!). An active audio filter (either op-amp or switched capacitor based) would be a good way to handle things at the LM386 input (or DSP if you want to go whole hog). Audio filters have the limitation that they can only remove undesired signals after they've been through the RF, IF, and detector stages with resulting intermodulation and other distortion effects that the filter can not remove - which is why IF filtering is so worth while, even if it's harder to do.

This is a Tube Checker that checks continuity of a tubes filament. If the filament is open the Tube Checker lamp will not light and the tube will not work. If the filament is good the lamp will light - simple. It will check most common tubes used in guitar amplifiers (12AX7's, 6L6's, 5U4's, 5Y3's, 5881's.....) tube radios, old phonographs, and if you're unfortunate enough to still have a tube type television, it will do those as well. This little Tube Checker also has a set of attached test leads that can be used to check circuit continuity. A guitarist/musician may find this feature a handy addition to the gig bag for checking guitar or audio cables, fuses, etc.

Thomas Edison describes in his patent application for the wireless telegraph in May of 1885 as follows;
For receiving signals I locate in said circuit between condensing surface and the ground a diaphragm sounder which is preferably one of my electro motograph telephone receivers.

The first wireless telegraph picked up the telegraph signals with a loud speaking telephone. De Forest patented his triode in 1907 twenty two years later. For his first radio he used an Edison loud speaking telephone.

Edison's Patent and an essay about wireless transmission can be seen on my site at www.geocities.com/starapex Click on the radio

I am giving some thought to getting into some mobile CW. The HF rigs
that are out there seem to be a bit of an overkill. I would just want
to be on 40 CW with a 100 watt or so signal. Is anyone aware of a
home-brew monobander that falls into this category? Would a QRP rig as
an exciter and an amp be a way to go? I have worked mobile CW QRP rigs
where one could hear a freq shift as the auto hit the pavement strips on
the interstate. I am sure that frequency stability as a function of
mechanical stability is a strong consideration. Any ideas,
experience??

I used it on a roller inductor once and the damned thing was never the same. It was very 'touchy' as to the alignment of the centre shaft. Obviously the sideways pressure of the shaft in the bearings is insufficient
to penetrate the silicone oil.

I didn't realise what I'd done until someone pointed out to me that silicone oil (as in WD-40) is used to disipate moisture and improve insulation. The very thing I didn't need! :-(

Cheers

Richard,

I would guess that you should see the chip pulling more current with an effective clock rate above 100 MHz. Without fiddling with mine I can only guess, but 300-400 ma would be my guess.

I would bet that you are off a bit or two on either the register address or the data to the status register.

If the current changes when you hit it with bits you must be hitting the control register to some extent so you are not off by much.

Enjoy

Bob

Hi ..i dont have the exact reference..but the author/inventors last
name is HART..he came up with a small LOOP that was in QST
and he had an antenna X article..perhaps 1989 and some details
are on the Antenna X site..it is a coax antenna that goes up the
tower and then away from tower abt 1/8 wave..and seems to
work well..I built a mini version for 40 meters but doesnt resonate
and im time restricted ect..anyone got some experience./info

One of the Ten Tec Tritons I owned (II or IV) stated in the manual that the steel in concrete highways did something--changed the distribution of flux from the earth's magnetic fields or something. So when you drove down the road, this changing flux cutting thru the PTO coil would cause a slight shift. And there really was nothing that could be done about it.

The homebrew mobile CW rig sounds like a cool project.

WD-40 does not contain silicone oil. It is merely a light mineral oil dissolved in Stoddard solvent (a type of refined kerosene). While the oil is a lubricant, it evaporates fairly quickly and should not be relied on for permanent lubrication. After cleaning the capacitors, be sure and lubricate the end bearings with a longer-lasting oil.

Many thanks for your comments again. It is possible that I have stuffed the chip as I was less than perfect in my static handling and I had to mount it by hand.and there was a fair bit of fiddling with the board to correct an error in the size of a SOIC component (An octal transceiver chip)
I have 3 boards and 4 chips so I will do a second version
I dont know how sensitive these devices are to static
As you say I get a clock out of IOUD in spite of repeatedly initializing the chip. Sometimes at initial powerup the IOUD clock disappears but I still cant get an output and this effect is not consistent which would suggest a problem with the logic due to static damage..
I write a 6 byte word to FREQ1 and the device is in mode 0 (single tone). - presumably this is correct though I note that the datasheet says at one point that the delta frequency word is read in mode 0 (?error)

I like TriFlow for this purpose. It's basically WD40 with Teflon --
seems to contain more Teflon per ounce than any other similar spray.

I once drenched a sheet of copper-clad board with the stuff, and dragged
a single #40 AWG strand through the puddle to see if it would have an
insulating effect. It did not (and this was with TriFlow, not WD40,
which as Barry notes is not Teflon- or silicone-based). If spraying
WD40 on a roller coil makes it intermittent, I'd venture to say it's not
the fault of the WD40 itself, but some other factor (maybe some bearing
tolerances loosened up under lubrication?)

In general, I like to use TriFlow on bearings and other mechanical
connections, and DeOxit D5 on electrical contacts.

3576. Help- how choose freqs of IF and LO ?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-12 01:02:38 UTC
From: Ignitron <ignitron@my-deja.com>
Message-ID: <8ukq7d$s5o$1@nnrp1.deja.com>
Source record: 56796

In receiver design, the choice of frequency for IF and Local oscillators is made with consideration to the receiver's coverage and tolerance of mixing products.

I want to make a superhet CW receiver to cover 40 meters and 30 meters in 2 bands, I wish to use a Kenwood VFO-120 which I believe puts out 5.5 to 6 MHz (or it may be 6 to 5.5 instead) I have on hand a good quantity of 4 MegaHertz crystals to use for constructing a broad and a narrow IF filter. I do not have a large investment in crystals so I can change to a different IF easily at this stage of design.

Can someone please direct me to a program or an Excel spreadsheet?? It should help the designer decide what combinations of frequencies for IF and oscillators and mixers will work well together. Some ham must have programmed a tool to make this selection thorough yet easy.

I expect to dig back into an old "receiver design" issue of Ham Radio magazine to research this subject further, but a short cut in form of some software would be appreciated.

Thanks in advance,
Don

I purchased a used 6 digit Galaxy III Deluxe Digital Frequency Counter at a hamfest today. It covers 1 - 40Mhz and uses a LC7232 chip. Do any of you have any experience with one of these?? I'd like to use it on my HB radios. The wiring harness has two wires together that are labeled Ground (black) and VCO O/P (white). The rest of the wires are loose and are labeled Ground (brown..this is the power ground), VCC +8V (red), USB B+ (orange), and LSB B+ (yellow). Any ideas on how to set this up to read the freq of my CW radios??

Thanks!

The bearings may indeed be loose. At first I thought the rubbing
block was loose or sumpin' but careful observation showed it wasn't.
There has to be some wobble in the shaft made obvious by washing
out whatever was in there before. Ex-military - was probably rare and
expensive.

As I told Barry separately, it was a can of 'generic' spray lube
with a funny smell. Proably from the propellant.

Would be far cheaper to just buy one from a company called
opto-electronics, or buy a used surplus lab counter. It is
a major undertaking to build a 'nice' counter, although there
are some '2 chip set' counter chips on the market. Build a
complete counter with 2 integrated circuits. But they are a
bit 'cheezy' and don't have the lab instrument look or feel.

3582. CB to 10 Help

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-12 07:27:36 UTC
From: VK4LAJ <vk4laj.SPAM.JAM@loaded-dog.com>
Message-ID: <3a0e4802@grissom>
Source record: 56652

Hi all,

Ok so I went to the local markets and what did I come across? A tidy (albeit dirty) General Electric 40ch SSB CB radio (model A3-5825B). So I think to myself hey this would be OK for a 10m conversion, bet he wants 100 bucks for it though.

I inquired as to the price and was surprised to hear; "20 bucks mate"

"Does it work?" Says I suspiciously.

"Sure does, want a demo?"

So after a bit of fiddling I established that the lights do indeed work. So I offered him $15 and he took it.

After getting it home I took its covers off and had a closer look. The internals look OK but I am a little concerned about a diode that has REALLY long leads (looks like a replacement) and the burn marks from the 200 watt soldering iron on D2?8 near the antenna plug (which incidentally is not connected to the board in any way. And I am at a bit of a loss as to why there is a piece of plastic with 6 extra switches on it that "Is part of the radio mate" but not connected to the radio in any
way.

Yep I know I probably bought $15 worth of spare parts, but to be honest I didn't expect anything more than that. At worst it will become spare parts, at best it will end up on 27MHz again, but IF I am really lucky I might have a cheap 10m radio for the car.

BUT! Before I go anywhere near this thing with a soldering iron I need a schematic for it and if possible the information to put it on 10m.

There used to be a book around that was called the screwdrivers repair book for CB radios (or something) sold by a local electronics supply house here in Australia but this book is not available anymore.

Can anyone offer information on the repair and or conversion to 10m for this rig?

Thanks in advance. Don't forget to remove the SPAM.JAM

Source record: 56660

Hi Don,

sorry, can't help with a spreadsheet, but looking at the info you've given can say this.

The frequencies you wish to receive are 7.5-8.0 MHz, and 10.0-10.5MHz (I presume a half megahertz coverage as your VCO has a half megahertz range). Your VCO does 5.5-6.0MHz. If you are wanting a single conversion receiver, you will need two seperate IFs. No first order combination of the received frequencies and VCO will give one IF. The IF will be either the sum or the difference of the VCO frequency and the received frequency.
For the 40meter band you could use an IF of 2.0MHz (difference), or 13.5MHz (sum). The 30meter band gives 4.5MHz and 16MHz. The easy choices would be 2MHz and 16MHz as computer crystals are easily available at these frequencies. 4.47MHz (I hope this is the correct value) crystals are also available in Australia (and probably Europe too) as the PAL (SECAM) colour carrier frequency.

Hope this helps. Do you have any information on using crystals in IF filters? I was looking for some on the net, but last time I asked only received some book references - difficult to find sometimes.

James.

well, the colour burst frequency is in fact 4.43361875MHz, but still
3.58MHz xtals seems easy to obtain at low prices in Europe, and many
other frequencies, some alternatives are 8.867 (colour burst) and
14324 which was used in Apple 2E+ and other early computers

Paul
I think I saw something in a magazine zillion years ago. If I remember correctly they ripped the 80-10 meter pi-network out and replaced with a proper sized one for 6 meter. I guess you need to modify/replace the HV-RFC as chances are you would have resonances or other nasty stuff with that. Oh yes the input matching would have to be "fixed" too... so you end up with at new RF side but using the tubes/power-supply/chassie stuff. If you get the amp cheap I guess it is worth it.

Cheers

Do you really need a tuned front end? If not, you can think of
http://www.minicircuits.com as your own personal tuner-construction
menu. They sell inexpensive VCOs, mixers, filters, and MMIC amplifiers
that can be used to construct just about any broadband 50-ohm RF system
with no more difficulty than hooking up a kitchen sink.

Hi John,

Thanks for response. Lots of interesting stuff on you WEB site!

I like to build a spectrum analyzer around one of those tuners.. Sort of
faced with a 50-60 Mhz IF so I one needs preselection I think.

Will look into the minicirciuits approach, Never thought about that,
quite frankly.

I can't understand why I can't find surplus tuners on the WEB. There
must be plenty around and I am also confused how those LO.s are driven
in VCR's, I guess it must be digitally, at least in the newer ones.

i found it very tough to find 25 ohm coax, hardline yes, but coax no.
i initally was tinkering around with a broadband 10-20 watt amp for a buddy
of mine and got caught up with turning it into a product. i had used a pair
of 50 ohm coaxes in parallel with good effect!

3596. Transistor Replacement for ARRL PS

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-13 07:03:49 UTC
From: Michael Hart <mhart-NOSPAM@terrigal.net.au>
Message-ID: <3a0f9329@turakina.six.asn.au>
Source record: 56663

Hi everyone,

I am building the ARRL 30amp PS described in the 1990 ARRL handbook.

The trouble is I cannot find the darlington pair 2N6576.

Can anyine suggest some replacement part numbers.

Michael

3597. Re: AD9854 Software

Hello Richard

Have you had a look at the source code for the AD9854 evaluation board. You can download it from the ADI site at http://www.analog.com/techsupt/eb/lin_eb/AD9852_54/AD9854.html.

Can you make the board layout available - the exchange rate with USA is killing me?

regards .. David

David

I had a look at the source code
It was quite involved with about 40 included files.
Most as to do with Windows interfacing and I didnt track down the
relevant section to drive the chip itself.

Richard

If you find it let me know... I can't even find a Mic cable pinout in the
owners manual.

An alternative is to use the mini DIN for packet on the Rear of the 207H.
The pinout for that is in the manual. The only disadvantage is the mic on
the HM98 is still in circuit when you use the din.

I am also looking for MH-98 circuit. connection. I am just looking to
find the PTT pin so I can remove the DTMF hold time on the PTT!

Also looking for the OPC-646 pinout which is a stiff $90, but it might
have active circuits. (pc clone cable)

I'm certain they are all voltage controlled. Though some might be a
better choice than others for your purpose, because greater integration
might make it more difficult to use the tuner as a non-stepped device.

It should be very easy to find such tuners, and if your first find
isn't suitable, another one should come along soon.

Places to look are tv sets, something recent enough that it isn't the
old turret type. TV sets have gone through some iteration since the
turret tuners were dropped, so some sets may provide a more useable
tuner. There was a time when TV sets were made where you'd have a fixed
number of channels, but little ports behind a panel to tune those channels
to your local selection. Then there are the sets where you could tune
all the channels, but they are all digitally tuned. I can't think right
now, but I'm sure there were some other schemes in between that all
used voltage tuned tuners. Keep an eye out on garbage day, and just
strip out the tuner. TV repair places are often a good source o9f junked
tv sets, and you might even ask them directly if they had any junkers.

External cable converters should also be a source. I see these at
garage sales in plentiful quantities, selling for about five dollars or
so.

VCRs have such tuners too. You may be able to find or buy for a minimal
amount a VCR that is mechanically broken, but the tuner works fine.

IN the tv sets, the tuners tend to cover segments, and need switching as you move up in frequency (though the tuning within the segments will be voltage controlled). So the VHF channels will be broken down into 2 or three segments, plus another one for UHF.

All the cable converters I've looked at tune in one band. I don't know how consistent this is, but from an article in Radio Electronics about building such a "spectrum analyzer", they showed a block diagram of a cable converter, and it tuned everything up to a fixed IF, and then in another mixer down to channel 3 or 4. I imagine a scheme like this is used in some tv sets.

VCRs probably use different schemes. SOme of the earlier ones had those little tuning knobs behind a panel, and I thought they required that you set a tiny switch to VHF-lo, VHF-hi or UHF. But lat4er ones probably act work like the cable converters.

Often, the tuner modules in all three instances are distinct modules, and have the pins marked on the metal case, though the markings may be a little cryptic. A little guessing, a little experimenting, and you should be able to figure out the pinouts.

The frequency coverage probably varies depending on whether the unit covers just the traditional over the air channels, or the cable channels too, since the latter puts channels into non-tv frequencies. Something that covers channels 2 to 13 probably won't go all the way up to 800 MHz, though perhaps the tuner would have some extra coverage on both sides. UHF would be covered by a separate tuner. SOmething that covers the cable channels would have wider tuning range, though I don't know the exact range.

I remember in one article about using cable tuners for a "spectrum analuyzer" that some tuners may be a better choice than others, but I think it was because some ran off a negative voltage.

Tuners that work with some digital scheme will have a prescaler on the VCO (though sometimes, the prescaler is separate), though often they have a high division rate. But it provides a means of measuring the VCO frequency; tuners that were merely voltage controlled may not have the prescaler, or any VCO output so you'd have to add that if you needed access to the VCO output.

It should be really easy to find something to get started, and if it doesn't work fully or not at all, a little more patience should turn up something locally for a few dollars.

Actually I've never run across a general-purpose commercial spectrum analyzer that uses a preselected front end at HF/VHF/UHF frequencies. The usual practice is a dual- or triple- (or even quadruple-) conversion technique, first upconverting the RF region of interest to a very high first IF. That way, a single fixed filter can be used to reduce image response (probably doing a better job than the front ends of the cheap CATV tuners).

For example, you could choose a POS-2120W ($21.95) to sweep from 1 to 2 GHz, driving something like an ADE-5 mixer ($3.45, hard to believe that's not a misprint). The IF would be around 1 GHz, with RF response from HF all the way to 1 GHz.

Then follow the mixer with a bandpass filter of some sort. Maybe a BLP-1000, followed by a MMIC buffer, followed by a PHP-1000; total cost about $30. You could probably omit the highpass (PHP) part if you wanted, with some additional risk of spurious signals coming through the whole chain. Better yet, buy one of the nice commercial-grade cavity filters that (for example) kmec@aol.com is always selling on eBay. The cell phone industry seems to dump nice UHF bandpass filters on the surplus market like they're going out of style or something. The choices are endless, because your image response is going to be many hundreds of MHz away from the desired sideband, and it won't take much filtering to get rid of it.

Once you have your 1 GHz first IF signal, you can mix it with a 950 MHz signal to get your desired 50-60 MHz final IF. Again, images should be no problem as long as you have even a crude lowpass filter that cuts off somewhere between 50 MHz and 2 GHz after the 2nd mixer.

You can get the ~950 MHz 2nd LO from another POS-2120W -- it would probably be quite stable with a simple fixed bias network, maybe a thermistor for temperature compensation, or a simple fixed-modulus PLL if you feel more ambitious. Most of the homebrew spectrum analyzer schemes out there just use a 10-turn pot or something similar to tune the CATV tuner's LO, so using another VCO with a fixed voltage divider as your 2nd LO wouldn't be a terrible thing to do.

If you want digital tuning, you'll have to drive the first LO with a PLL of some sort, or at least a high-precision DAC. An obvious solution would be to multiply the output of a DDS VFO by 256 or so. A 74HCT4046 from Radio Shack could do the job, with a frequency divider made up of some of the Motorola ECLips chips. I wouldn't try this at first -- it's a fair bit more work, and it wouldn't make sense unless you phase-locked the 2nd LO as well to keep it from drifting. Just tune the VCO with a precision potentiometer, and you have a workable DC-1 GHz receiver front end for less than $100. With all the cheap 50-ohm system components out there, it's all just plumbing.

One VERY nifty advantage to a 1.0 GHz 1st IF would be to use a cheap 2 GHz handheld counter to monitor your 1st LO with a piece of black tape over the first '1' digit. Voila -- your receiver or spectrum analyzer now has a direct-reading digital frequency display.

Also, be sure to have a look at Wes Hayward's analyzer project page (http://www.teleport.com/~w7zoi/SA.html) for further ideas and construction hints.

Actually, I guess I wouldn't count on the POS-2120W to go down to 950 MHz -- it's rated for 1060 at the bottom end, and while those types of VCOs usually have a good underrange margin, that particular model might not tune down that low. Probably better to use a POS-1025 or something that has the desired 2nd LO frequency right in the middle of its tuning range. You get the idea, anyway....

Hello All !

I have a Yaesu Ft101e with speech processor, AM filter, xtals for 160 thru 10 -- plus 17 meters !!!!!!
Also have the SPECTRONICS DIGITAL READOUT and the FT650B 6 meter transverter . Copies of all manuals AND the FT101E FACTORY SERVICE MANUAL. Some FOX TANGO articles. No manual for the readout (IT works great -- I like it better than the FC601 - it has the built in sideband offset) I do not wish to break the rig it up !!! It is in very good condition and EVERYTHING works fine. Make an offer before it goes to e-bay.

I was unable to find a cross for your part, but remember, motorola
was famous for 'house' numbers, I would say, just grab an E.C.G.
transistor cross referance book, and pick what you need for your
circuit, and forget about what the old one 'was'.

3624. Micor repeater

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-16 00:00:00 UTC
From: tigerbiter@webtv.net
Message-ID: <11148-3A13B560-4@storefull-167.iap.bryant.webtv.net>
Source record: 56608

I have a few problems with the repeater and need some suggestions on where to look.
I think part of the current problems are still related to a recent lightning strike so here goes.
The receiver works great with no transmitter on line. Receiver frequency 143.9000Mhz, Transmitter frequency 148.1500Mhz, Civil Air Patrol RX sense at 0.22uV at 12 dB Sinad, 0.28uV at 20dB Quitting. Not bad at all.
TX 70+ watts no frequency drift. 2nd harmonic -63dB, 3rd harmonic -72dB after replacing the filter. This is very good.
Now for the problem.
When the transmitter is on at 50+ watts the receiver goes into oscillation and does not hear anything as a result. This is with the transmitter on a dummy load with or without a duplexer, and the antenna on a dummy load as well.
I have run the final pa on a separate power supply thinking that the new power supply may be over loading but this is not the case.
I have also run the 9.6VDC on a separate power supply for the same reason.
The oscillation is there only when the transmitter rf power out goes above 50 watts out and sometimes you have to go above 70 watts to get this problem to occur.
Any ideas would be a great help.

This isn't really an amateur radio question but almost :) ,
at work we have a standard industrial rf generator for 13.56MHz,
operates at powers from 5W to ~800W.
This macine produces a gas plasma inside a vacuum chamber.
This plasma is closer to 25ohms and the manual recommends using 25ohm
cabling instead of 50.
At this point we have a little mismach resulting in some reflected
power.
Someone suggested using two paralell 50ohm cables but I am somewhat
sceptical.
Still, it's pretty low frequency (not exactly microwave :) and the cable
isn't taller than
say 50cm so cutting two identical lengths should pose no problem.
But will it help? Connectors must still be 50ohms since that's all we
can find,
at least for RG-217 cable with hv-N connectors, and the plasma chamber
is still matched
for 50...
The question is would we gain anything from doing this if it's even
possible?
Would appreciate a reply,

Regards //Anders

> The oscillation is there only when the transmitter rf power out goes
> above 50 watts out and sometimes you have to go above 70 watts to get
> this problem to occur.
> Any ideas would be a great help.
>

Here are a couple of WAGs:

1. A spur from the transmitter that happens to be on the receiver
frequency. If the transmitter happens to be putting out a spur
on the receive frequency there would probably be enough leakage
from the coax to radiate a signal to the receiver. Try retuning
the transmitter or look at the output on a spectrum analyzer if
possible.

2. Broken coax shield. Check the coax from the transmitter to the
power meter and from the power meter to the dummy checking for
a break in the shield. I had a problem like this in a mobile
installation once: A coax connector on a low VHF radio came

loose. When the low VHF radio was keyed it caused a howl in a UHF radio in the same vehicle. That was cured by screwing the coax connector back on.

Note: You didn't tell us what the receiver RF input is connected to. Also, when you say the receiver oscillates, what is the actual symptom you observe?

Yes it's possible and practical to use a parallel pair of cables. If the frequency is low and the cable length is short, there isn't much to be gained. If the length is less than about 1/10 wavelength it's short.

On the other hand, if the length is over 1/4 wavelength, consider increasing it to 1/2 wavelength and you will have a good match with any impedance cable.

Use of 50 Ohm connectors for 50 Ohm cable is proper. If you are using two cables, use two sets of connectors. But again, if the frequency is low, the connectors aren't important.

Hello all,

I am wondering whether ICOM uses Phillips' I2C bus standard for programming their newer HTs.

Also, does anyone know where to find documentation for the command language used by these HTs?

I am considering trying my hand at coding my own applications for my T81A. Thanks.

Hello Michael and Others,

You provided quite some useful info. It is clear to me now, that
they (the tuners) all use VCO's and that some are driven directly
with a DC voltage and that others are driven by the voltage from a
comparator/freq synthesizer. The new designs that use remotes etc

My question is how difficult is is to separate that driving module from
the actual vco drive point.

Another qustion I have is is the freq range of these VCR tuners if
they say 181 chaneels. from 50 to approx 800 MHz?

I found a web page with a nice clean design, but I do not like to
draw attention to it. If you contact me direct I will send you the URL
The reason? Well I am sure by now, that this tuner business is a hot issue
as it relates to the scanner laws in a way. And that is the reason that so
many links have gone dead.

Hi Dr D,

Tnx for message and info. Yes I had seen that page earlier and had
a little problem watching it as it in Postscript. But I got it printed.
As said in a previous message I think we should not draw attention to it
because whoever has it up there, may violate some Fed law. The reason
I write this is that after long searches with search engines I have
gotten convinced that there is something going on about these tuners
and the docs about them. TOO many dead and not available web pages.

Regards Rein

Hello John,

Again thanks. I have not had the time to look up the minicircuits
catalog. The approach is certainly attractive. But at thia point
I like to go with the tuner route
There is a lot of tuner specs info available from Asian sources
and what they publisch is not too bad as far as image and NF data
are concerned.
My intention is just to have a device that I can use to tune LO's
perhaps filters in short as a simple tool to help with a number of
vhf / uhf projects I want to do.
Your modular approach is certainly something I will look into if I ever
make it up to 10Ghz.

If I understand correctly, your cable is only 50cm long, total. With so short a cable run at 13.56MHz, there's very little advantage to bothering with two cable runs. Since the length is far less than 1/4 wavelength, the key advantage would be to lower the power dissipated in the line; that's a benefit you'd not get if the line was long, but it does apply for lines which are very short (and loaded with high current). But whether you use one line or two, the load presented to the RF generator will be very nearly the same, and very nearly the value at the plasma-chamber end of the line. So in either case, it's important that the RF generator can be tuned properly into that load. If not, you can gain some advantage by using a matching network (at either end of the line, but slightly better if it's at the load end of the line) to cause the correct load at the RF generator.

Cheers,
Tom

Hi Dr. D

Thanks. I have 3 tuners here for 0 - 450 or so, 400 - 900
and 900 -1400
I would like to get one for 50 to 800 though.

If you can direct me to one or more of those wholesale
places, that would be great.

Rein Smit

Hi Bill and others,

Thanks for your input. I have been running a new search effort
and came up with a some info on channels, etc.
Thanks to Michael,VE2BVW for his search tips.

I put it on in a new WEB page (more to follow) as:

http://www.fortunecity.com/skyscraper/pixel/100/catv50.html

Just to repeat. My interest in this whole threat is to locate
a tuner for a homebrew spectrum analyzer or to learn what to
look for on the fleamarket without having to buy 10 vcr's in
the expectation to find one!
I have yet to find a place to buy one. You are right they are
offered in Nuts and Volts in large quantities.

Thanks and regards

Rein

There a number of "generic" CATV tuners avilabe from commercial
outlets like MCM Electonics and Parts Express. I am currently working
on a RCVR based one I bought for that purpose it has a 70 Mhz IF using
a xtal filter fron a cell phone, the reciever is a TDA 7000 IC and LM
380 audio amp. Tuning is with a 100K 10 turn pot.

You can go to Agilent's website at www.hp.woodshot.com, and you will be taken to the page where the current version of Appcad can be found. Among othere things, such as MMIC, bipolar and JFET biasing, you will also be able to do cascaded noise figure calculations in addition to the mixer spur calculations that you need.
Oh, did I mention that this is a free download! You have two choices on the type of download; you can either download the setup file in on 7.8MB file, or in several files (Disk1, Disk2,.....etc.) I downloaded mine in one large file, and it worked fine.

I work in CATV and if I was pressed to find a 800 Mhz
set-top converter, it would be darn difficult to find a
plain-jane one without addressable and decoding functions.
Basically there's no market for them. The same topic once
came up on one of the CATV groups in regard to availability
of a 750Mhz box. They do exist, but I've never seen one or
had use for one.
The 'good' surplus re-sellers only deal in quantities and
normally wouldn't sell any descrambling units to an
individual. It would likely be a $80+ item anyway.
I think your best shot would scanning curbsides for an old
TV or VCR.

Further thoughts to what I posted yesterday...

If you were to make the RG-217 35.5 electrical degrees long (about 1.45 meters, if I've calculated correctly, assuming velocity factor = 0.66), using a single 50 ohm line, and then put about 157pF of capacitance across the RF generator end of the line, the generator will "see" very close to a 50 ohm load, assuming the load on the other end of the line is 25 ohms resistive. In that case, the loss in the line will be roughly 8 watts per 1000 watts, or about 0.035dB. I'd say that's not enough to worry about, and if you don't have matching problems with your line 1/3 as long as that, the losses surely must be insignificant to you.

In summary: if the generator can deliver the power in your current situation (with a nominally 25 ohm load at the generator), there's probably no reason to hassle with doing it differently. If generator matching is a problem, you might improve things by making the line a bit longer and putting a capacitor (RF current rated!!) across the genertor end.

Cheers,
Tom

From: Skipp <skipp@pilot.ucdavis.edu>
Message-ID: <8v424v$9ac$1@mark.ucdavis.edu>
Source record: 56636

Hello there,

You simply have in cab de-sense (may not be spelled right), a common problem especially in mobiles radios converted to repeater operation. Motorola and other mfgrs sold an enhanced shielding kit for all their radios, even the duplex mobile micors.

In some radios, the kit was additional filter networks (coils and bypass caps) at all the backplane and module connectors. The micor duplex kit also had differen or more metal covers in place.

You should really consider just running the repeater at 40 watts and getting on with your life. The difference is not that much in the final signal.

One desense and intermod problem I had was partially solved by swapping out the receiver in my MSR-2000 repeater for the same type with the duplex filter equiped receiver board.

Various models of radio and brands have different ways and locations for their respective filter kits. The micor base/repeater had two or three versions which are best described in the service manual. I worked for years at Motorola Service Station, so I've been there... done that.

Hope that helps... feel free to Email me direct if you have specific questions.

cheers

If you doen't specifically want vertical orientation, the easiest way by
far is to buy a second 20-meter whip and cobble them together base-to-base
as a HORIZONTAL dipole.

It looked really wierd, but I had (until it got hung in the pull rope on
my garage door!) such a dipole on my pickup truck and it REALLY "got out"!

Hi;

I am looking for some PCB layout shareware for Win95 thats easy to use
(for a novice) and will output to an HPlaserjet 4L printer onto some
resist transfer sheets. Any recommendations.

The project I am working on is a small L-band transverter with MMIC's
and a minicircuits mixer.

Thanks!

I have wondered about that also, because I have seen it written b/4
that ICOM does use the I2C bus. But then again, I believe that the
I2C bus requires both a clock lead and a bi-directional data lead,
so I am confused.

MCM doesn't sell "surplus" in the conventional sence, most all products
are prime A stock. As far as the Feds go I wouldn't worry. And dead end
URLs are common in the electonics busness. Companys, and manufacturers
come and go.
If you still having trouble finding tuners, Science Work Shop
(www.science-workshop.com) has them for their "Poormans Spectrum
Analizer" kit. They will gladely sell you what you need. I can also put
you on to other Whole sale sources.

Good luck

I can never remember the scheme for cable channels. They aren't linear, ie
higher numbers are higher in frequency. They go back and fill in the
gaps that are used by other over the air services. I also thought there
was more than one scheme, though that might be outdated information. I
just did a websearch, and found some charts of channel to frequency
correlation, but none of them displayed clearly on my browser to make
full sense. You might do a search yourself, I think I used "cable channel
frequencies" as the keywords, to get the information.

So the upper frequency would depend on the scheme used, how many channels.

This isn't a definitive comment, but of the scrap pieces of tv equipment
that I've looked at, virtually all have had the modules in a form
that would make them very easy to use for other purposes, provided you
can figure out the connections. I can think of only one (though perhaps
I threw some others back without remembering them, because the tuners
weren't useable) where the tuner module seemed to be less definable.

It was a Zenith if I recall, and the front end was not in anice metal
module. It was more a regular circuit board, with some shielding, and
it seemed to have some of the synthesizer circuitry built right into it.

Of course, it all depends on what you can scrounge up. I may have just
been lucky to look at tv sets and cable converters where the tuner
modules just contained the analog circuitry.

We got our eval. board (9852) thru the swedish dealer. Cannot comment
on price as I was not the one ordering the stuff!

But I got two free!!! eval boards for their ADF411x PLL chips! Even
including a TCXO....

So far, I have just tried out a 25-35 MHz ckt using a MCL POS VCO and
using a NE5534 op to boos the tuning voltage. Works like a charm!

Thank you Analog! This makes an engineer HAPPY!!!

I'm planning to build one. I don't know what kind of circuitry is
used in the commercial analysers so I'm not sure of the best
way to proceed.

I think I will need to build an oscillator that can deliver
several volts of RF into a 50 Ohm load. The oscillator
output must have very little harmonic output.

The output of the oscillator will drive a bridge circuit. There
is some useful information about RF bridges in chapter 7
of Solid State Design for the Radio Amateur (ARRL).

I intend to use the frequency display on my web page:
http://www.qsl.net/ei9gq/stab.html

Any comments or ideas would be appreciated.

I have used "www.expresspcb.com" for a couple projects. Their software is
easy to use and their service was excellent. They have cut prices for
small boards too.

I have a Motorola power supply that appears to be from a commercial fm base station. Has the number HPN1003A on the chassis. Seems to be 14.5 volts but have no idea what its current rating is. Anyone have the current rating of this supply? Thanks!

Peter is quite active on the 80M homebrew net (3.727MHz). His e-mail
address is included in the RadCom article. If you don't have it, send
me a message to: nospam AT oceanfree.net - Sorry about the SPAM trap.

> Has anyone completed this project and can help me with the programme, or
> preferably a chip ready to go, I know 'nowt' about PIC's and programmes!

Several of the 3.727MHz gang have built the project.

73, Ed. EI9GQ.

Why use a CAD-program???
Most "simple" PCB-programs are more a burden than an aid for analog constructions!

I would try using any drawing program such as VISO! Using "smart shapes" you should be able to do neat striplines and easy to make footprints for your mixer and MMIC.

Most PCB-proggies are very hard to get going and takes ages to fully (if ever) understand

Good Luck
Lasse SM5GLC

3683. AD9854 Software AAAAARGH!!

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-19 00:00:00 UTC
From: richardh@iinet.net.au
Message-ID: <3a178bd5.28284875@news.m.iinet.net.au>
Source record: 56560

Gday all

This project threatens to defeat me - still cant get the beast to fire up.
I have built two boards to ensure the problem is not chip damage - but the second behaves in the same way
I have designed my own PCB which is all surface mount. The board is made professionally. The chip seems to mount OK with hand soldering (I was careful with static!) all connections tested OK
Two 3.3V supplies using KF33 regulators
Serial Interface to the Atmel AT90S8535 controller via a 74 LV573W and voltage limting circuitry (5 to 3.3V)
Clock is 12.5 MHz at a suitable voltage 1V P-P around 1.6V
This appears OK as the chip generates IOUD pulses at pin 20

I think the problem is software as the chip does not appear to initialize
software as follows

```
INITIALIZE_DDS:
;******************************
; 0.1 second delay routine
; with 4 MHz clock
; Wait after power up until stabilized
;******************************
rcall DELAY_100ms
ldi temp,0 ; Initialize DDS port
out DDS,temp ; Chip select active
cbi DDS,DDS_CS
sbi DDS,DDS_RESET ; Assert DDS master
reset to initialize
nop
nop
nop
nop
cbi DDS,DDS_RESET
sbi DDS,IOR ; Reset serial
interface
nop
nop
nop
nop
cbi DDS,IOR
;
;**************************
```

```
; Set up control register
;
;
;**************************
ldi temp,8 ; bit counter
ldi temp_1,0b00000111 ; Serial command word
- Write to addr 7
; (control reg)
I_DDS_LOOP0:
cbi DDS,DDS_DATA
sbrc temp_1,7 ; If most sig bit set then set
data bit
sbi DDS,DDS_DATA
sbi DDS,DDS_CLOCK ; Transfer data to DDS
cbi DDS,DDS_CLOCK
lsl temp_1 ; Next bit
dec temp ;
brne I_DDS_LOOP0
;
ldi temp,8 ; bit counter
ldi temp_1,0b00010000 ; Comp powered down,
DACs,Digital active
; MSByte in control reg
I_DDS_LOOP1:
cbi DDS,DDS_DATA
sbrc temp_1,7 ; If most sig bit set then set

; data bit
sbi DDS,DDS_DATA
sbi DDS,DDS_CLOCK ; Transfer data to DDS
cbi DDS,DDS_CLOCK
lsl temp_1 ; Next bit
dec temp ;
brne I_DDS_LOOP1
;
ldi temp,8 ; bit counter
ldi temp_1,0b00001111 ; PLL range low, PLL active,
Multiply by 15
; 2nd Byte in control reg
I_DDS_LOOP2:
cbi DDS,DDS_DATA
sbrc temp_1,7 ; If most sig bit set then set
data bit
sbi DDS,DDS_DATA
sbi DDS,DDS_CLOCK ; Transfer data to DDS
cbi DDS,DDS_CLOCK
lsl temp_1 ; Next bit
dec temp ;
brne I_DDS_LOOP2
;
```

```
ldi temp,8 ; bit counter
ldi temp_1,0b00000000 ; QDAC source internal,mode 0
(single tone)
; freq update external
; 3rd Byte in control reg
I_DDS_LOOP3:
cbi DDS,DDS_DATA
sbrc temp_1,7 ; If most sig bit set then set
data bit
sbi DDS,DDS_DATA
sbi DDS,DDS_CLOCK ; Transfer data to DDS

cbi DDS,DDS_CLOCK
lsl temp_1 ; Next bit
dec temp ;
brne I_DDS_LOOP3
;
ldi temp,8 ; bit counter
ldi temp_1,0b01000000 ; Inv sinc filter off,shaped
keying disabled,MSB first
; serial data out disabled

; 4th Byte in control reg
I_DDS_LOOP4:
cbi DDS,DDS_DATA
sbrc temp_1,7 ; If most sig bit set then set
data bit
sbi DDS,DDS_DATA
sbi DDS,DDS_CLOCK ; Transfer data to DDS
cbi DDS,DDS_CLOCK
lsl temp_1 ; Next bit
dec temp ;
brne I_DDS_LOOP4
;
rcall DELAY_100ms ; Wait for internal update
sbi DDS,IOUD ; Update registers (just in
case the internal update hasnt worked!!)
nop ; To change control reg status
; To external update before
writing more data
cbi DDS,IOUD
sbi DDS,IOUD ; Update registers
nop ; To change control reg status
; To external update before
writing more data
cbi DDS,IOUD
```

The update clock setup is somewhat confusing in the datasheet
Presumably the initial update occurs autonatically until the control
registers are updated when an external update will then be possible
(or perhaps the control registers do not need an IOUD?)

I would be grateful if any of you boffins out there have the time and inclination to look at this

You can get narrow ceramic 455 KHz filters from Broxbourne UK
These are used in some commercial SSB rigs OK

3685. Re: 160/80 m. antennas with single cable?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-19 00:00:00 UTC
From: richardh@iinet.net.au
Message-ID: <3a17bc6d.8401207@news.m.iinet.net.au>
Source record: 56562

You could tie the feeders of the 80M dipole together on 160 and feed
it as a top loaded vertical against ground. You would need to match it
obviously and would need a reasonable ground system say buried radials
Depending on the height above ground this is quite an effective
antenna on 160

Thinking about this, the automatic internal update clock is not
synchronized in my circuit - it would probably be active before the
initialize routine is finished - presumably this would prevent proper
initialization
It still doesnt work if I initialize without the clock and then start
the clock - does the logic section need the clock running to work?

Here's one idea for debugging -- build a PC parallel port interface to the chip and see if you can get it up and running in C. :) That should be much easier to debug than trying to bring the microcontroller and DDS up at the same time.

I'm curious why the current one is inferior. I'd expect a decent double-balanced mixer to do quite a nice job of generating AM. In fact, that's what's commonly used to generate AM in high quality signal generators. (I've recently been working in the area of improving overall system linearity in a very respectable sig gen, and although the DBM contributes some to the distortion, it's not the key contributor, and in any event, the distortions are way below what you'd worry about on the ham bands.) Could there be other areas where you could make more improvements?

Cheers,
Tom

Hi

Looking for recommendations on a "beginner"s to advance" tutorial for Linux / Unix preferably a pdf file that was intended to be read from beginning to end (not a help or reference manual).

I have seen a lot of them out there and the problem is to choose one and start learning, I can"t read them all.

So far I got:
RUTE USERS TUTORIAL by Paul Sheer
and
UNIX IS A FOUR LETTER WORD AND Vi IS A TWO LETTER ABBREVIATION by Christopher C. Taylor.
Both look good and I"m awaiting your recommendations.

THNX, Jeff

3693. Re: 160/80 m. antennas with single cable?

Newsgroup: rec.radio.amateur.homebrew

Source record: 56570

I feed with a single coax and balun a bundle of dipoles cut for each band, except the 160, didnt have space for that. They were all cut for the center of the band, then not even trimmed, just used that way. They are close, and the tuner does the rest. All will tune.

This will work, I do this and then match it with a tuner, have recieved
good reports many hundreds of miles away. People claim that the inverted
L is a better choice though, but the T configuration does allow for use
on both 80 and 160.

This a bit off-topic for the homebrew radio NG but I suppose Linux
is the software equivalent of homebrew radio. Homebrew software
as an alternative to commercially produced software.

The best way to learn about Linux is to install it and use it. There
is lots of good information in the Linux Documentation Project. I
think the URL is: http://www.ldp.org

3700. Re: PCB Layout Software for Win95

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-19 00:00:00 UTC
From: Joe Leikhim <jleikhim@nettally.com>
Message-ID: <3A186827.AFB508A5@nettally.com>
Source record: 56577

Thanks JW, I have gotten a couple of suggestions but ExpressPCB is the most intriguing. I am trying it out now to get the hang of it. Would you happen to know if they have a more complete library of components? I was happy to find clock oscillators, but found no RF components like MMIC's. Even if I have to hand craft them, their price is pretty reasonable, especially since I haven't done any board etching in years, a task I really dislike.

Message-ID: <15127-3A18881F-63@storefull-227.iap.bryant.webtv.net>
Source record: 56578

I need help with an old Trans Oceanic model 1000 chassis # 9ct40z2

It seems the pin that is the "+" is grounded. I checked this with my meter and there is continuity to ground. I opened the set up and removed it from the cabinet to have a look around and see nothing that might have smoked. Can anyone please help me out as to what next to look for. With 12 volts to the radio all you get is a very slight crackle when you hook power to it from the speaker.

Also found one cap going to ground. I took this out and now have a hum, but still no sound and also the output transistors seem to be overheatig.

Thanks,
Dave.

The micro side is working OK as I have got various other peripherals
(LCD, rotary encoder) working OK
I am wondering if I have missed an obvious step in the initialization
process - hopefully the answer is quite simple
Apologies for the assembly - but I thought it described what I have
done so far as well a psseudocode

You can tap the oscillator of an old VCR tuner and use that to drive
a return loss bridge connected to your antenna. There is an idea
here: http://www.gbonline.com/~multiplx/wireless/appendixF.html#12

3720. NEW KIT: UniCounter - accepting orders

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-20 05:37:56 UTC
From: ka3j12@my-deja.com
Message-ID: <8vadbkjvk1@nnrp1.deja.com>
Source record: 56583

Hi Everyone,

The UniCounter is a low cost ($25 postpaid), very flexible frequency counter/electronic dial kit. An article on it was just published in QST - December 2000. A brief description is provided below and more details can be found at: http://homestead.juno.com/rsstone/unicounter.html

A final field test has been occurring this month and has proceeded quite smoothly. So, I'm now ready to offer kits to anyone interested. Ordering information is provided below and at the above website that also will have shipping status updates. I plan to ship any orders received by 11/28 on 12/14. Orders received after 11/28 may not get shipped until after the holidays. To help me order parts as quickly as possible, please send me an email after you mail your check.

So far, this has been a very exciting and rewarding project for me. I hope that others will benefit from it was well.

73,

Ron (KA3J)

UNICOUNTER DESCRIPTION

The UniCounter can serve as a bench counter (offers 10 Hz resolution up to 30+ MHz), and as an programmable electronic dial for up to 8 radios. Cost was kept low by using a single 7 segment LED that displays the digits (up to 8) serially. You can select the digits that you want displayed and the display rate. The fastest display rate is equivalent to about 74 WPM - fast enough to quickly find a specific frequency while tuning through a band. The UniCounter also can be programmed to handle most common mixing schemes and reverse tuning VFO/VXOs.

The display rate, digit range, operating mode (continuous display versus single display/sleep), offset mode (mixing scheme selection), and 7 offset (calibration) digits are stored in a frequency display profile. Up to eight profiles can be programmed and you can switch between them in seconds. This allows you to quickly move the UniCounter from rig to rig. The kit includes all board-mounted parts. You just need to supply a switch (almost anything will do), a DC power jack or battery clip, some coax, and a case for the 1.5" x 2.5" PC board.

---------- ----------

ORDERING INFORMATION

Complete kit (PC board, all board mounted parts and instructions) - $25 postpaid; Partial kit (programmed PIC, crystal and instructions) - $17 postpaid.

Payment must be in US funds; US and international money orders and personal checks (US only) are accepted. Payment should be made out to Ron Stone and sent to:

Hi and thanks for reading this post

I recently acquired a General Electric 40ch CB radio Model A3-5825B (twin board model) with the view of putting it on 10m.

Has anyone got the schematic diagram for this radio as I don't have one and the rig has been tampered with by someone. Currently the lights come on but there is no-one at home (no RX/TX). It appears that components have been added and subtracted but I don't know what the correct ones should be.

Any help would be appreciated. Scanned schematics are OK but please email me direct and don't forget to remove the SPAMJAM

Thanks in advance

3730. DDS Synthesizer with AD9850

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-21 00:00:00 UTC
From: David Suffys <david.suffys@pandora.be>
Message-ID: <16zS5.193894$iI2.3667290@afrodite.telenet-ops.be>
Source record: 56459

Hello,

I ordered some samples at Analog Devices of the AD9850.
I am willing to build a LO for a homebrew HF receiver (as it seems that a LO with a DDS has considerably less phase noise)
I learned a lot with the article of G3XJP.
This is what I would like to do.

I have a 100 MHz reference oscillator (feels great if you work for a telecom company)
I will load the data in the DDS via the serial or printer port of a PC.
Anyone have a Visual basic program which can control these ports?
Anyone knows what the pectrum is like in the output, I saw the datasheets but what is this DDS doing in real life?
I think it will be easy to filter out harmonics but I am a bit afraid about mixing products.
Anyone have a good idea how to couple the output of the DDS to a mixer?
Does anyone have experience in using this DDS. Schematics etc...

Thank you in advance.

Dave on4cgj.

You want to hit http://www.qualcomm.com for their DDS app notes and
study them carefully. (The same basic principles apply to all
numerically-controlled oscillators, not just the Qualcomm DDS parts).

Yes, you'll get less phase noise than just about any other technique...
but phase-truncation spurs and DAC noise, which is just as big a
problem, will take its place. You can build a reasonably-clean DDS VFO
but its spectral purity will never compete with a traditional VFO unless
you clean its output up with a tracking filter and/or PLL.

DDS should be thought of as a useful tool for frequency synthesis, not a
complete solution in itself.

I am looking at a non-English circuit diagram which has unusual values I am not familiar with.

For example are there such discrete resistor values as 11K, 11K3 and 101K7 etc? (are they a special range of resistors and can I just substitute equivalent values using regular components?)

What is a DPA177P (or maybe OPA177P)? (it's some sort of IC looks like might function as a 741 but does anyone know what it is and does it cross reference to anything more everyday and common I might be able to source here in our limited supply market?)

3737. Schematic for RS232/TTL Conversion (i.e. IF-232C clone)

I want to build a "clone" of the Kenwood IF-232C. I know that W1GEE and "JBI" have such products, but would rather homebrew one if someone out there has a schematic.

A friend has set up a web site for me to sell off a 29 year accumulation
of electronic components including:

RF power and other transistors, RF I.C.'s,
Minicircuits mixers, ceramic 455kHz and 460kHz filters,

Variable capacitors, both panel mount shaft type and trimmer
variable inductors and coil forms, RF feedthrough and standoff capacitors,

High voltage: VACUUM RELAYS, RECTIFIERS, resistors and capacitors,

Other capacitors including, Photoflash, polypropylenes, tantulums,

Switches, such as foot switches and industrial limit (micro) switches,

Ferrites cores, Transformers and inductors,

Transistors for power audio amplifiers and television deflection,
Super fast (35ns) 1 and 3 amp rectifiers, and lots, lots more.

My idea is to hang a LM335 out my window to return a voltage equivalent to the outside temperature. This device gives a linear voltage output against temperature independent of voltage supply, based on 2.7315V at 0C. Seems so simple.....

But..... when I check numerous commercial circuits for temperature sensors they all delve into complex multi chip circuits. They typically incorporate an LM335 somewhere but always use external probes to measure temp. They explain how their circuits function in great technical detail but none of them say WHY they do it this way. I wanted to know the principle of operation (or rationale behind the thinking) and not the technical details at component level.

So I bought a home construction kit to see how they did it but even they say the reason for the complex circuitry is because I have to compensate for ambient temperature and add it to the probe temperature voltage and one chip is to compensate for the non-linearity of the probe and another chip is for something else etc. But once again they do not say WHY it is necessary, they just say you do it this way. None of them use the LM335 to actually measure the outdoors temperature and I am wondering if i am missing something important here? What is wrong with this device? Ambient (outdoors)temperature is what I thought I wanted to read and why would I want to compensate against it and why does it require an additional probe just to read outside temperature?.

Can I hang a LM335 out the window or not?

The resistor values are undoubtedly 1% or closer tolerance parts. The 101K7 (101.7k ohms) is probably 0.1% or closer tolerance. That would match with the OPA177, which is a "precision op amp" from Burr-Brown. You should be able to get the data sheet for it from B-B's (now Texas Instruments') web site.

If you are repairing the item (an instrument??), you probably want to try to use accurate resistances to maintain circuit accuracy. You might do OK by putting two resistors in series or parallel, but I'd want to use low-drift parts, at least, to maintain accuracy over temperature (and over time). The OPA177 has very low input offset voltage (25uV max), low drift, and high gain. You can probably substitute other similar amps, if you can't get an OPA177.

Hope this helps...

Cheers,
Tom

The simple answer is, don't use aluminium!!!
I find the easiest and cheapest way to make boxes is by using copper clad board, and soldering it together. You are able to construct any shape drill any hole anywhere on the box, solder nuts to the board and use bolts to fix panels etc. You can even use the inside of the box case as the circuitboard, drilling through to mount psu connections antenna sockets etc. It cuts with stout snips, and you can etch the front panel for legends on/off, rf gain etc....reinforcing where necessary for heavy items such as transformers is not a problem, you just bolt plate metal to the areas to be strengthened...

Hi All,
I've made a few aluminium cases
the method I used was to score the
sheet with a stanley knife and a
steel rule,you should then find the
sheet will bend on the score line
(score will be on the outside)
and then dress the bend with a file
works for me
all the best .....Peter

3753. DDS Synthesizer

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-22 00:00:00 UTC
From: m_donohoe@dingoblue.net.au
Message-ID: <3a1b920d.6217070@news.dingoblue.net.au>
Source record: 56485

Looking for schematics for a design that can used to give up to 100Hz
frequency resolution at 144-148MHz.

I know that the easiest way to do this is probably by mixing the DDS
output with a PLL Locked VCO output.

Anybody have any projects that already do this?

Schematics!!!!!!

3754. SA612 as a Balanced Modulator

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-22 00:00:00 UTC
From: Murray Lang <muzzle@iexpress.net.au>
Message-ID: <_7NS5.2$Kg1.1683@wa.nnrp.telstra.net>
Source record: 56486

Has anyone used an SA612 as a balanced modulator?
I bought one thinking it was functionally equivalent to an AN612 but it's not, quite.While they're both balanced mixers, the SA612 doesn't seem intended for audio modulation. What concerns me is that it has no balance adjustment. I tried it on a prototyping board and it seems happy to modulate with audio signals. As far as I could measure, the carrier was suppressed about 30 dB. I'm not sure how much of this I can attribute to the high capacitances around the prototyping board.

Any thoughts?

Regards
Murray - VK6HL

Look at Analog Devices AD9852 on the web site. Eval board with
everything you need is $200-$300.

I'ld like to do the same. I've got samples of AD9852, but can't find a
suitable pc board. Can't quite afford thier eval kit. How are you
mounting and soldering your's?
I'm also fooling around with moving the last IF stage into the PC thru
the sound card and making IF filters thru DSP programs. I'm writing the
program in C++.

3757. A New In-line HF Return Loss (SWR) and Power Meter

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-22 00:00:00 UTC
From: Paul Kiciak <pkiciak@att.net>
Message-ID: <3A1BBCD4.657401D2@att.net>
Source record: 56489

I've just put a new website together that describes a design for a return loss and power meter. Using this meter, you can measure up to 30 dB of return loss, which is equivalent to a 1.07:1 SWR, with as little as 1 milliwatt of forward power or as much as 300 watts. And it will also display forward power from 10 milliwatts to 300 watts.

If you're interested, go to:

http://home.att.net/~n2pk/

All comments or questions, sent to this ID or n2pk@att.net, would be appreciated.

73,
Paul, N2PK

Subject:
[HomeBrew] About PC-HamRadio Power Supply Conversion
To:
homebrew@qth.net

Hi all HomeBrewster,

these are the results of some experiments made by my friend Tony and I working around some PC PSU :

All units we've examined were switching-mode-type constructed around a solid-state controller like the Motorola TL494C or similar (pin-to-pin clones of this chip are, per example, NEC uPC494 or Fairchild KA7500B). The
idea is : feeding the Inverting Input of the Op-Amp dedicated to the control and the amplification of errors with a little voltage taken from the Reference Voltage Pin across a variable resistor we can cheat the control unit and force it to raise the output voltage. Tony tried for first
this trick and yesterday night announced me by radio, obviously alimentated
by the ex-PC unit, that all was working well. The fact that I received the
message was a confirmation of all that :)

For a step-by-step procedure try this (Warning Mumble-Rumble : You perfectly know in a PSU there are HIGH voltages and BIG capacitors. Be sure
to turn everithing off, to unplug AC plug, to discharge capacitors, etc.
etc.). Once opened the PSU search for a medium-size, cute chip (normally the only one present) with eighteen pin or so. There are two possibilities
: it's one of the chips I mentioned or it isn't. Let's think for the moment
it is. Solder a piece of wire about 30 cm. long (~1 feet) on the pin 2 (Inverting Input First Op-Amp error amplifier) and another so long piece to

pin 14 (Reference 5V output). Let exit the wires from a hole in the
metal
box (normally there are a lot of holes because of the cooling) and
solder
them to a variable resistor (aka varistor). Try first a rather big one -
100 KOhm or so set to the max resistance. Close the box and turn on the
PSU. Turning a little the varistor you would notice a raising of
voltage.
Turn very slowly because we noticed that those PSU are self-protected
for a
maximum output voltage (someone turn themself off at 16V, some other at
21
depending upon the model). If you fall into protection no problem : turn
off the power switch, turn back the varistor and it will be newly Ok in
a
few seconds. It's a good idea to put a fixed resistor in series at the
varistor to avoid turning-on of the auto-protection circuit.

If you notice, instead, the usage of another chip, connect to a good
electronic detail site(Eg. http://www.questlink.com) and try to find
its
DataSheet. Normally you can find in your chip pins with the same
function
as Pin 1, 2 and 14 of the TL494 or KA7500B.

Another helpful mod : if you connect the wire, instead of to Pin 2, to
Pin
1 (Non-Inverting Input First Op-Amp error amplifier) , turning the pot
you
will notice a decrease of the Output voltage instead of a raising. So
with
a switch or with a good opposite dual variable resistor with the maximum
in
the center you can build a very flexible bench PSU : now Tony's gives
from
8 to 21 V from the old 12V connector and from 2 to 8 V from the old 5 V
connector. This strongly depends on the type of the PSU.

Bye and 73 to all You from Ticio and Tony.

PS : I never found a PC PSU not working without MotherBoard connected or
charge applied, however those created for AT Form factor MotherBoards
(You
can recognize them for having the MB Connector normally white, always
split
in two parts with 6 cables in line each).
If you have an ATX PSU (the MB connector is rectangular, two lines of
cables, normally opaque transparent plastic) you must short to ground
the

Subject: [HomeBrew] RE: Computer switch mode supplies
modsTo: <homebrew@qth.net>

Dear Tizziano
Ammichi !
VERY GOOD POSTING ...
Have a few questions...that a I am sure others subscribers
to "HOMEBREW" will be interested too.
1. The typical AT form factor supply has a " POWER GOOD "
pin that connects to the motherboard...
What do you do with that pin ?
2. HOW MUCH CURRENT can you obtain from the + 12 volt
supply (the one which is now capable of changing
from 8 to 21 volts according to your posting) ?
3. Same question for the +5 volts, which normally is
the one rated for more current in old supplies
4. WHAT DO YOU DO WITH THE SWITCHING NOISE ? I mean
how do you filter out the noise that those supplies
produce on the radios !!!!
I can get some of those supplies that are broken down,
so if you amigo have any information on the most
typical defects, then there are going to be quite a
few very happy radio amateurs here !!!
Do you have circuit diagrams for those supplies that
you can scan and send as attachments ?
Is there any good source of written technical information
on how those switch mode supplies work ?
All your help in this project is most appreciated,
as there seems to be now a complete generation of
computers of the XT and AT generation that are
going out, and their supplies are certainly good
to recycle for amateur radio.

From: Mikael <Mikael.Nordman@piuha.net>
Message-ID: <8vgemt$19in$1@ws3.piuha.net>
Source record: 56491

Hi,
I have used the NE602, which is about the same device.

You can adjust the balance slightly,
by adjusting the voltages on the audio input pins.
I think those are pin 1 and 2.
Connect a 10 Kohm trimmer between pins 1 and 2.
Then connect a 470 Kohm resistor from the middle trimmer pin, to Vcc.

Still,you wont get an extremely deep null.

The SSB filter should buy you 20 dB more carrier suppression.

Mikael, OH2AUN

Hi Doug & Group:

B&W 3033 specs are as follows:

Coil diameter: 3"
Turns per inch: 6
Coil length: 10"
Wire size: 12
Inductance: 71uH

It is an air wound coil-miniductor with four equally spaced plastic (polystyrene?) supports.

What are you building?

Best to all,
Hubie

I believe TriQuint makes some DDS parts that can be clocked up to 500 MHz or so. They may be tough to get, but a single-chip solution may be feasible if you can pull it off.

I had an ACC rc-850 repeater controler that used the lm335 and it just hung outside (in a protective cover) with 2 wires going back to the controler. In the book there is a simple circuit that gives a high accuracy input. There is a 12 volt supply then a 10K resistor in series with the lm335 to gtound. Off this junction there is a 20 K resistor to the inverting input of an opamp. From the junction of the opamp and the 20 k resistor is a 100 K to the output of the opamp. ON the noninverting input to the opamp is a standard ciruit of a pto connected to the + supply then to the input then to the ground. This gives a 0 to 5 volt range from just below 0 deg F to about 150 deg F.
The resistors should be 1% to keep the gain constant.

These guys have 4, 5, and six pin coil forms here

http://www.oselectronics.com/ose_p85.htm

Or you could do what I did. I built a 75w HF cw transmitter last year when I got my novice license. I didn't want to pay the $7 per coil (I needed eight all together). So I got some PVC tubing and did some calculating to wrap my own coils using the standard PVC diamater of (I think) 1 1/4 inches (for one inch tubing).

I wrapped the coils and then I got some PVC caps and bunch of 2 conductor mini phone jacks from radio shack. I drilled holes into the PVC caps and epoxied two jacks each into the caps then soldered the wrapped wires to the jacks and then attached the caps to the pipe. They worked just fine for me and when I built my 5 band superhet reciever this summer I used the same technique for the tuning coils in the radio. by unsing three conductor stereo jack you can emulate 5 and 6 pin coils as well.

YOu will have to start with the lower exams and work up. Things have change lately so I moy not be totally correct but think you will have to passthe Novice, General , then Extra written exams. Not sure where the Tech license exam comes into play now if you want more than that class to start with. YOu can take all the exams in one day if you want to. Also for the Extra or General you will have to have a 5 WPM code test to get the full license.

YOu may want to go to the ARRL.org web sight and download the questions and answers. The way it works now is that there is a pool of a bunch of questions. From these you will be asked a given number and have to answer so many correctly. I don't know the numbers righ off. These are the exect questions you will be asked on the exams so you really do not have to learn anything but just have a good memory.

3777. HELP! PLUG IN COILS NEEDED!

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-22 02:21:26 UTC
From: danos@aztec.asu.edu
Message-ID: <8vfaj6$k6t$1@news.asu.edu>
Source record: 56479

Please help me! I have been a ham for 40 years and am still homebrewing;
and now I need as many 4 pin plugin old fashioned coils. The plugin
coilforms even by themselves would be ok. I am currently building up a
classic vacuum tube sideband transmitter that will run about 75 watts
but I am not sure what the PEP is just yet. Only that the DC input is 75W.

This is my first DSB rig and am looking forward to the fun that I will have
with it.

Long live the homebrewers.

73,

dan de WD8PCU

3778. TDA 7000 FM RCVR IC problems

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-22 05:27:39 UTC
From: dr.dongle@juno.com
Message-ID: <8vflg7ufv1@nnrp1.deja.com>
Source record: 56480

Are there any pitfalls to using the TDA 7000 FM rcvr IC that are not apparent for the onset? I'm trying to build a rcvr with this IC (based on an artical in a magazine) and am having NO luck. The VCO is running I can see it with my HP scope.

3779. Re: Schematic for RS232/TTL Conversion (i.e. IF-232C clone)

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-22 06:24:23 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8vfoqfdbr1@slb6.atl.mindspring.net>
Source record: 56481
Body handling: HTML body converted to readable text

Use a Maxim MAX23x chip for a single component solution. They offer the chip in a standalone, one IC solution, or a similar ship that requires the addition of 5 capacitors to populate all input/output channels. It is a TTL to RS-232 level translator.

I don't remember all the numbers and which require no additional components, but the series is MAX232, MAX230, MAX233. These are available in DIP or SOIC configurations, and up to 8 samples are available per request from their website.

http://www.maxim-ic.com/

Samples can be requested at the following link

http://dbserv.maxim-ic.com/sl_requests2.cfm

Here is a link to their data sheet and app notes on this line

http://dbserv.maxim-ic.com/quick_view2.cfm?pdf_num=1798

Hope this helps,

David

3781. Help on Collins VFO??

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-23 00:00:00 UTC
From: Walter Treftz <boomer1@hitter.net>
Message-ID: <3A1D765D.4E5CAC11@hitter.net>
Source record: 56512

Maybe some of you military collectors can help me!!!

Have an obviously oscillator subassembly that would
like to consider using for the VFO on the new WARC
ham bands with an old Viking II-CDC that I have
(could use conventional old ham VFO for the older
bands but need something for the 10/18/24 mhz bands.

This unit appears to have "maybe" come out of an
AN/ART-13, Navy TDH (big 5kw jobbie) transmitter
(as that is the only places I have seen these knobs)

All I know is;
1) Has "Colling Part Number 344E" embossed in
top of the subassy.
2) Uses an 837 tube
3) Knob on front (with small revolution counter)
like on ART-13 or TDH
4) Size: 12" deep x 4" wide x 4.5" high.

Does this ring any bells??? Can anyone supply data
(schematic, freq output, etc) or anything at all
on it??

Any/all help/info/input will be greatly appreciated.

From: Murray Lang <muzzle@iexpress.net.au>
Message-ID: <Du_S5.1$fl1.5275@wa.nnrp.telstra.net>
Source record: 56509

Thanks Mikael,

Yes, the NE/SA612 is just a 602 with somewhat better specs. I think it's worth me spending the time to design a circuit board around it. The nice thing is that the same chip and oscillator can be easily set up as an SSB demodulator.
Regarding the biasing of the audio input, I'll give it a try. The datasheet says that these pins should not be biased but if it works then so what!

Thanks again.
Murray

I didn't think the question was all that clear. My first thought
was that he didn't like an SSB with carrier signal (I know in
the old days the rigs would unbalance the modulator, but not
bypass the SSB filter, though I don't know if that's the way
this particular rig works), so he wanted to build up a standalone
modulator that would inject after the filter.

My second thought was that so long as he wanted a low-level AM modulator,
the state of the balanced modulator may not be as important as the
stages of amplification that follow.

I have used the large sized pill bottles that the pharmacies use to dispense
prescriptions as coil forms. I've used the smaller sizes as well. I think
the plastic in them has better electrical characteriatics than PVC.

What you describe is a wire-wound resistor, not a choke. Mouser
Electronics (http://www.mouser.com) has them - stock number
280-CR10-240 at $0.55 each.

3800. Re: Choke for Eico needed

Newsgroup: rec.radio.amateur.homebrew

Sounds more like a resistor.

While you may not be able to find a kstock # almost any resistor near
240 ohms and 10 watts or greater should work if it will fit in the
space.
You might even find one at the local Radio Shack as the resistor should
not be that expensive, but many places have a minimum order and the
shipping and handling will be much more than the part.

3801. Re: DDS Synthesizer with AD9850

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-25 00:00:00 UTC
From: Bob Camp <bob@cq.nu>
Message-ID: <ZQQT5.324775$4d.40284487@news02.optonline.net>
Source record: 56532

David

The close in phase noise (within 10 KHz of carrier) of the DDS will be pretty good. The far removed from carrier (> 1 MHz) will be ok, but you can do as well with other techniques.

The spur performance of the DDS will be a major problem. You can expect a forest of spurs starting quite close to carrier (maybe 100Hz) and going on forever and ever. Spur level will vary a lot with tuning word, but in most cases will be in the 100 dbc range for a whole lot of spurs and in the 70 dbc range for a few of them.

The noise reduction you get with the DDS does not help as much as the spur increase hurts.

In order to get back to the roughly -135 dbc/hz noise and no spurs of a standard rx oscillator you should plan to do some cleanup after the DDS. If you want to get to the -160 dbc/hz level of a very good rx oscillator you may need multiple stages of cleanup.

Typically people use phase locked vco's and vcxo's for some of the cleanup. They also do stuff with narrow band crystal filters. A lot depends on what you are trying to do and how much stuff you have in the junk box to fiddle with. Generally this stuff is weird enough and expensive enough that scrap parts are the only way to go.

Enjoy!

Bob

Richard,

The internal update clock is running when the chip is reset or powers up. It will load any data you put into the chip. The only time you need to supply an external input for the update clock is when you have shut off the internal update clock via the status register. If you still have a pulse train coming out of the clock pin you still have the internal update clock running. If you do not have a pulse train coming out of the clock pin you may or may not have the internal update clock off. You can set the internal update clock divide register to a low value like two that will not put anything out the pin, but will still do the internal updates.

The main use in watching the update clock pin is to see if you are hitting the control register or not. Most people turn off the internal update clock with the first stuff they throw at the DDS. The clock going away is a good way to tell if you did it right.

If by any chance you can get your hands on a logic analyzer for a couple of hours they can be a great tool for debugging this sort of problem. I had a single extra half clock cycle in my code when I started out with this chip. Messed everything up. The logic analyzer showed it up right away ....

Enjoy!

Bob

About once a month I post the availability of this font that I had
modified by a commercial font designer. It is a true slashed-zero Andale
Mono fixed-width font extremely suitable for DXBase 2000 / 2001 and really
any logging software. It's advantages are two-fold

1. It allows for easy discernment between O's and 0's with the slashed zero

2. Because it is a fixed width font it provides perfectly aligned columns in
the DX cluster windows.

Available as a 47K zip file download with installation instructions.
Last month there were over 230 downloads of this font.
It is on the Software Download Page of my site directly beneath the text
that describes DXBase 2001. Enjoy.....it's FREE.

Doesn't almost every font have a slashed zero (ï¿½) as one of the characters? I just checked a few of my fonts and all of the ones I checked did.

Yep, but an Apple computer, for instance, won't display that zero
correctly if it was typed on an IBM/Microsoft machine.

From: Dennis DeLorme <dennyd@attglobal.net>
Message-ID: <3A200B19.CE7CF740@attglobal.net>
Source record: 56537

I just hang it out the window, with some shrink tubing around the
connections to protect them from the elements.

The LM335 output is in Kelvins so some additional circuits may be needed
to convent to Celsius or Fahrenheit since Kelvins is not commonly used
by the general public. I run the output of the LM335 to an A/D converter
and do the other processing in software.

If you want to do a direct readout you could use a digital voltmeter
chip like the 7107 and adjust the full scale and offset without
additional chips.

The chip works best with a constant current so in an extreme design they
may feed the LM335 form a constant current source. The LM335 acts like a
variable resistor in that the voltage across it changes with temperature
(duh! - the whole point of using it). This voltage change will affect
the current through it - the amount depending on the value of the source
voltage and the series resistor. Think of it as a variable voltage
divider. I have found that with a 12V source the problem is minimal. If
you are running from only 5V there may be some effect. In general the
higher the source voltage and larger the source resistor the better.

For direct Fahrenheit and Celsius National has come out with the LM34
and LM35.

Ya, but...

Just because _you_ can type a slashed zero with your font, and just
because _you_ can see it's rendering on _your_ screen, means *nothing*
for the hundreds of thousands of usenet users out here.

I suppose your font is proprietary to the operating system from
from the convicted monopolist from Redmond, Washington -- nicht wahr?

Is there anybody out there who cannot see the slashed zero in the parenthesis above, or in the parenthesis here (ï¿½)? I was under the impression that this character was included in standard ASCII, and therefore should be visible on all computers using western character sets. Perhaps I'm wrong.

> I suppose your font is proprietary to the

You're wrong. I see a question mark in the parenthesis when reading the
post, and backslash three three zero in writting this followup.

The default character set here is US-ASCII; I had to change it to
ISO-8859-1 to even get this thing to post.

They work great, especially the larger sizes when used with old octal tube
sockets. These may be hard to find, but if you find any they can be used,
along with the sockets, for really great plug-ins.

That is not slashed zero, it is a vowel in at least Norwegian and
Danish, the uppercase ï¿½ is at U+00D8 and the lower case ï¿½ at U+00F8.

>Yep, but an Apple computer, for instance, won't display that zero
>correctly if it was typed on an IBM/Microsoft machine.

These characters are in the same positions in Unicode, ISO-8859-1 or
Latin1 (as used by most modern unixes), Windows code page 1252 etc.

MS-DOS and Apple have both their own incompatible code pages for
Western European languages. HP-UX had their own incompatible code
pages and of course all big IBM machines use EBCDIC, which is
completely incompatible with anything else.

Standard US-ASCII (ANSI_X3.4-1968) is that obsolete 7 bit character
encoding containing 0..9, A..Z, a..z and 24 punctuation characters
and 32 control characters. Standard US-ASCII and its international 7
versions (ISO-646, in which a few punctuation marks were replaced with
non-English vowels and consonants) were used in most non-IBM computers
into 1980's. For instance the mechanical Teletype or the VT-100
terminal supported only US-ASCII or other international 7 bit
variants.

The only way to display the (ï¿½) character on these systems is to use
a Danish or Norwegian terminal and send the 0x5C code to the terminal,
which on the US-ASCII terminal would be displayed as the backslash (\)
character.

In 1983 the VT-220 terminal supported an 8 bit with some modifications
became the ISO-8859-1 (Latin1) in 1987 supporting most Western
languages at the same time, includes the (ï¿½) character.

Thus, if you are using 7 bit devices, such as VT-100 terminals, you
will not see that character.

>> I suppose your font is proprietary to the
>> operating system from from the convicted
>> monopolist from Redmond, Washington
>> -- nicht wahr?

Western Windows variants use code page 1252, which is superset of
ISO-8859-1, so the ï¿½ is in exactly the same position.

However, in MS-DOS, the US code page 437 does not contain the ï¿½
character at all and the Western European code page 850 keeps it in a
different position, thus, some transcoding is required to display it.

The Mac Roman character set has the ï¿½ character in yet an other
position, so some transcoding is still required.

>The character in parentheses looked somewhat like a slashed zero on this >Macintosh, but it really is not.

As far as I can figure out, there has never been any slashed zero characters in any computer character sets. However, there has been a large number of font variations that displayed the ordinary digit zero in somewhat different ways. Some used a completely round glyph, other used an elongated glyph, some a truly elliptical glyph, some a zero with a right facing slash, some with a left facing slash, some used a centre dot and some even some kind of underscore to distinguish from the letter O. All these are simply glyph variations of the ordinary zero digit.

On hard copy devices you could use overprint by sending the digit 0, backspace and slash. In Unicode a slashed zero could even be constructed by using U+0030 U+0336 (digit zero and combining long stroke overlay).

All the talks about slashed zero appearing in all fonts is a misunderstanding, by people who think that Norwegian and Danish uppercase vowel (ï¿½) U+00D8 and lover case vowel (ï¿½) U+00F8 look like a slashed zero. I am writing this on a Norwegian keyboard layout and that vowel is immediately to the right of the L-key. This paragraph should be correctly displayed on any system supporting ISO-8859-1 (Latin1).

Yes, but it's *not* a zero...it's <Option><Shift><o> Hex 'AF' which
may not display the same in other fonts or operating systems. As far
as I know, codes above 127 are not part of the ASCII standard, which
is 7-bit, and they will vary from implentation to implementaion.

An ascii zero is 30 hex. Other codes will display what looks like a slashed zero on some machines. Software, such as logging programs and call sign capture functions in terminal programs, are not likely to recognize these other characters as a zero. Sending anything other than 30 hex should be avoided. If you want to see a slashed zero, the correct way to do it is to install a font that displays a slashed zero on the screen for 30 hex.

3823. Re: Choke needed for Eico 751

Source record: 56402

I get a little worried, and wonder whether someone shouldn't be swimming in shallower waters, when a voltage dropping resistor is confused for a choke. I'm not trying to be snide, but "safety first" used to be the ARRL mantra and this is clearly a case where someone is out of their depth. (Not that the Eico 751 ps is rocket science.)

Richard
Just came across the AD9854 message thread. Don't know if you've solved your problem yet but I may be able to help. When I started using the AD9854 serial interface I had many problems. I finally talked to the guy at ADI that designed the interface and he helped clarify a few details lacking in the data sheets. I hope they have updated the data sheets since the initial release.
The problem arrises because the chip is in auto-update at power-up which means it will use the internally derived update clock to transfer the new data to the registers. Unfortunately this means that if an update cycle occurs while data is being clocked into the chip it will use whatever it has. In my case the chip would shut down after a few programming cycles or it would jump to the wrong frequency.
The only way around this problem appears to be to wait until the chip has been programmed to turn off auto-update mode and then apply the master clock. Very cumbersome but it does appear to work.

Hope this helps.

Gary

What I see is an equal sign ("=") with a vertical bar ("|").
It be one of the "IBM Graphical Characters" for drawing boxes: x'D8'.

>I was under the
>impression that this character was included in standard ASCII,

Standard ASCII !!! LOL !! At best ASCII is 'standard' up through
x'7F' -- and is wide open for (re)intrepretation from x'80' - x'FF'.

According to the news headers, you are using linux and slrn and your character set is declared as iso-8859-1 and the original message also contained an explicit code page declaration of 8859-1. How on earth did you manage to display the original text in MS-DOS (OEM) US code page 437 :-). There is definitely some problems with your configuration.

This makes me curious. In the US, is it legal to operate a CB that has been converted to 10 meter Ham operation, assuming of course you are a legally licensed ham with privileges on 10m? I'm not sure how this would be different from building your own radio from scratch, which is legal.

If it is illegal, I'm wondering how other countries view this kind of thing.

Just curious,

Never say never. Almost all of the older home PCs had the slashed zero. My trs-80 does. I just fired up my Commodore 64 and my 128, both of them have the zero slashed (heck they even have the zero slashed on the keyboard).

A slashed zero font with it really being the zero and not a special character is a cool addition. Being Monospace helps, there aren't that many monospace character sets out there that are easy to read.

Did you ask "Jo Ann's" if they could order some for you? Most fabric shops can order cloth they do not stock.

You might also want to check with Porter's Camara Store (www.porters.com). They used to carry this fabric, but I've not seen it recently in their catalogs.

I also used to see it advertised in Shutterbug magazine (but I don't remember seeing it lately - but then I've not looked for it).

And, finally, you might also want to try some of the fabric wholesale catalog stores that advertise in many of the sewing magazines. These can deliver almost anything.

> Almost all of the older home PCs had the slashed zero.

Many early PCs displayed the ASCII zero with a slash on the screen.
The ASCII character however was 30 hex, the same character that
displays a non-slashed zero on most fonts. 30 hex is and always has
been the *only* valid ASCII code for zero. It is up to the receiving
terminal design to determine if the displayed zero character has a
slash or not. Any other character will fail in software analysis even
though it may "look" like a zero on the screen. The only proper way to
display a slashed zero is to have the receiving machine display a
special slashed zero font in response to receiving a 30 hex or to have
the receiving software send a slash zero "look alike" to the screen in
response to receiving a 30 hex.

Hello--
Also, IIRC many of the late-1970s-vintage "dumb terminals" (e.g., Televideo 910, ADM xx, etc.) either included a permanent slashed zero in their character-display ROMs or had a switchable option to display either a slashed zero (or one with a dot in the center?). Can anyone confirm this?

Never expect a character typed using the Option key on a Mac to come out the same on a Windows machine. Never expect a character typed using the Alt key on a Windows machine to come out the same on a Mac.

The character in parentheses looked somewhat like a slashed zero on this Macintosh, but it really is not. It was typed by holding down both the Shift and Option keys while typing the letter "o". If a Windows user typed what looks like a slashed zero, when I looked at it on this Mac I have no idea what it would look like, but I'll bet it would look different (unless he typed an ordinary zero; then it _WOULD_ look like a slashed zero to me).

This is one reason why Mac users should never use the Option key in e-mail or newsgroup posts, and likewise Windows users should never use the Alt key. I figured out from context some time ago that the lower and upper case Pi characters I occasionally see on this newsgroup really were intended to be 1/4 and 1/2. I can get those Pi characters by using the Option key, or both the Shift and the Option keys, with the letter "p" (easy to remember) but I have no idea what they would look like to a Windows user. Let's find out: Here's the one with Option alone: ø. And here's the one with both Shift and Option: ø.

By the way, the current versions of the Monaco and Mishawaka fonts (both monospaced), and the Chicago font (not monospaced) on the Mac give a slashed zero just by typing the ordinary zero. Since I use Mishawaka as the screen font for my e-mail program (Eudora) and my newsreader (NewsWatcher) I see lots of those slashed zeros onscreen.

Amateurs have a very privileged status in the U.S. Every other service may only operate type accepted equipment. We can operate any piece of junk that we can buy, build, modify or cobble together, as long as it meets the technical standards of the service. As technically skilled operators, we are expected to understand that our equipment does meet those standards.

The only limitation applies to external power amplifiers below 144, and specifically between 24 and 35MHz, where there are some restrictions on what we can build/cobble together.

>>
>>
>
>
On my machine you get a 'ï¿½' like this...
Turn on the 'num lock'.
While holding down 'alt' type 0, then 2, then 1, then 6 ON THE NUMERIC
KEYBOARD (or whatever you call it - you know what I mean - the one which
has the 'home', 'pg up', 'end' etc). After you have typed the '6',
release the 'alt' key.. and up pops the 'ï¿½'.

Note: the 'top row' numbers DO NOT work.

Cecil (W6RCA) did post (some time ago) a list of the interesting
characters which he had found between 'alt0130' and 'alt0255', although
I find that mine seem to start at 'alt0161' (I only get 'ï¿½' before
that). 'Alt0181' is a useful one - it's 'ï¿½'.

There are two problems...
1. I believe that everybody may not receive the 'correct' character -
eg, the 'alt0181' should be a Greek 'mu' - who didn't get this?
2. I haven't worked out how to do this on a laptop where there is no
numeric keyboard.

ï¿½ï¿½ï¿½ï¿½ï¿½ ï¿½ï¿½w!

Ian.

>but I don't think the 4046 can lock onto harmonics.
>

There are two types of phase comparators in the 4046 and one of them will lock on harmonics, but I doubt if it'd go high enough in frequency for a general coverage radio.

You may want to consider using a couple of diodes as a sampling comparator. You can use tubes, and make it a completely tube type system.

Since this detector has no pull-in range, you will have to preset the VCO close to where you want it, and make the system "sweep" until it phase locks.

This system tends to be a bit finicky in that you can lock onto the wrong harmonic and you need to restrict the tuning range of the VCO to force it to lock to the desired harmonic, but it DOES work and quite nicely at that.

I'm looking to use radio equipment for a specific application.
Motorsports to be exact.

I want something that I can put in a car with me and hook up a
microphone in my helmet to speak to crew or other teammates cars. I'll
also need earbuds to be able to hear everything. The range needs to be
about 2.5 miles at a minimum.

What sort of equipment do I need to do this? How much money?

How does licensing work?

Thanks for your help in advance

Gary
Thanks for your info
I was getting around to this. I tried starting the clock manually
after initialization but this still doesnt seem to work - maybe there
is another glitch in my software. Another idea suggested was that I
try writng a large number the update regisster (all 1s) to allow a
longer period between updates so I could get my control word in to
turn off the internal update clock. I will try this tonight.
In retrospect maybe the default condition at reset should have been
external update :-)

3855. 500 KHz Harmonic PLL 1st LO?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-27 00:00:00 UTC
From: wb0poz@prodigy.net
Message-ID: <8vtr7k$dlvo$1@newssvr06-en0.news.prodigy.com>
Source record: 56434

I'm in the "thought process" stage of designing a mostly tube 3-30 MHz general coverage receiver. In considering my options, I was wondering if anyone could point out the disadvantages and potential pitfalls of a simple first LO synthesizer using an oscillator tuned by a variable cap for coarse band changes which is then phase-locked to a harmonic of a 500 KHz reference?

Here's what I'm thinking: a 6AH6 wide-range VFO (covering switched 2:1 or 3:1 ranges), a couple of varactors across the tank. Cathode follower to a 74HCT4046 phase detector, other phase det input from a 500 KHz square wave. Phase det out thru an active filter then feeding the varactors.

I don't want to use programmable dividers, etc., as this would detract from the "old buzzard" style of receiver I'm trying to build. Suspect that this method would not win any prizes for phase noise performance, but is it going to be truly terrible in this regard? How about lockup stability - I don't want to bump the receiver and then have it lose lock, nor do I want to use a micrometer to tune the VFO. Am I gonna have a big problem stamping out spurs and mixing products from reference bleedthru?

I've seen transistorized projects like this, and even built one years ago, but I was dissatisfied with its lockin ability (but then again, it had a pretty crummy phase detector).

Thanks for any help.

John - W3JN (ex WB0POZ)

Ann Arbor terminals had a slashed zero as did all of our competitors. The
IBM 3270 and compatibles had a dot in the center. The early computers did
not have video displays, they used ASR33's and other Teletype Corporation
products as I/O. The early computers that used Video terminals carried over
the slash zero as they were called "glass TTY's".

Jeff:

On a board like the one you want, where the traces are large, you could probably hand draw them directly on the copper board with a resist pen (Sharpie's from WalMart work fine). Neatness is a virtue, but not a necessity here...use a straightedge if you want a professional look.

After the resist ink dries, you can etch it in garden variety ferric chloride. Radio Shack used to stock PC board supplies and almost any general purpose electronic supply house will have them also.

Photoresist and other fancy methods are nice when you have to duplicate many fine traces onto a board, or when you want to make many copies. But for "one of a kind" boards, with a few large traces, I would go with the resist pen method.

Both examples use the extended ASCII character sets associated with your particular code page. A true slash zero will display with the normal ASCII zero in the 128 character code set (030)

3869. Where to loacate what value of loading coil ?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-27 02:51:22 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <8vsiesddf3@plutonium.btinternet.com>
Source record: 56424

NOW AVAILABLE, Program "LOADCOIL.exe"

COIL LOADED VERTICAL OR SLANTING ANTENNAS

This program does a job similar to program Vertload. In some respects it is a more accurate model. It is easier to use - input data is entered in a more logical form and requires less thinking about. Assistance with coil design and performance prediction are the principal features.

In particular, coil height is entered as a percentage of overall antenna height and there are facilities to 'slide' the coil up and down the antenna when searching for the height of maximum efficiency. Overall height, coil length, coil diameter and frequency can also be continuously and rapidly varied in fine incrememts via the keyboard.

Output data is in a more interesting form. The effects of the coil's self-capacitance on self-resonant frequency and on Q when the coil is mounted too high up the antenna are also shown.

The program covers a wide range of antenna proportions, from VHF via 10 to 160 metres, vehicle mounted or at base stations. Anywhere where a vertical or slanting (or perhaps even an inverted L antenna) is appreciably shorter than 1/4 wavelength and performance would benefit from insertion of a loading coil somewhere along its length.

A detailed description of how the location of the coil affects operation is included. Data is provided to assist users to crudely estimate input resistance of a set of buried radials.

One small binary file: 52 kilobytes. Download from website below in a few seconds.

Hi All,
Me again!! Thanks for the replies on the twist-lock caps. I have decided to just re-make the PC board for using computer grade caps.

Hi All,
I am in the process of rebuilding a Clipperton L amplifier. I have to make a new power supply PC board. I have the layout on a piece of acetate, but am not very good at transferring that to copper and etching.

Does anyone out there know how to do this and would you be willing to do a one-of-a-kind board. I will gladly pay costs, etc. The layout I have on acetate is a positive image of the traces/pads to be left on the board after etching. It is a one-sided, simple power supply board for a Clipperton L, approximate size 5.25 x 7.1875 inches.

Any help out there?

Regard,
Jeff W8CQ

>If I remember correctly, the ASR-33 had a slash through the zero.

Today we would call it a font or glyph variation. It was printed, when
0x30 was sent to the terminal (or 0xB0 if odd parity was used). There
was not a separate character code for slashed zero.

The print cylinder (or whatever it was called on ASR-33) did not
contain _both_ the ordinary zero and the slashed zero.

Thus, the slashed zero did not appear in the character set as a
separate entity but rather as a glyph variation. The same applies to
the early home computer character generators with _only_ the slashed
zero (but not ordinary zero) in the character set that others have
commented in this thread.

Today, would you considered a zero printed in italics to be a
different character when printed in boldface :-).

Hi John,

I'm not 100% sure, and I don't have a data book handy, but I don't think the 4046 can lock onto harmonics. You may just want to use exor gate or similar. What you are describing sounds similar to the FRG7(000) implementation of the band changer, they even have a lock light - can you find any data on it, if not let me know and I'll see what I can find for you.

James.

Sounds like you want to implement a VFO stabiliser. My old RSGB Radio Amateur Techniques (6th edition) describes a "Huff and Puff" stabiliser which is intended to lock a VFO to small increments. I can't comment on how well that idea works with wide channel spacing. I think I saw a VFO stabiliser in the 2000 edition of the ARRL handbook as well.

You might want to take a closer look at the Barlow-Wadley loop. This is a famous design that's been used by Drake, Yaesu, Racal and...well...Barlow Wadley to name a few.

Here is one web site I've found with information:
http://members.nbci.com/barlowwadley/barlow.htm
Note the "Harmonic Generator" box at the top left of the block diagram.

I hope this is useful.

Have you considered injection locking, which is used in some microwave
projects. A comb generator generates all the available harmonics from
the reference and possibly after some bandpass filtering the signal is
applied at a low level to the VFO. An oscillator is just an amplifier
with a frequency selective feedback and feeding a signal that is only
slightly off the VFO resonant frequency will capture the injected
signal, generating a strong signal at the same frequency as the
injection. By reducing the injection level, the lock in range can be
reduced, eliminating the risk for locking into wrong harmonics.

Now that there are available a large number of various crystal filters
in the VHF range e.g. from HF receiver roofing filters or surplus
mobile phone 1st IF filters, why not just build a tunable filter to
select the right harmonics from a comb filter ?

Using a tunable VHF VFO, mix up the spectrum and pass it through the
crystal filter. Using the _same_ VFO mix down the filter output and
low pass filter it and feed it directly as the LO. Some tuning
indicator will be required, so that the VCO can be tuned in such a way
that one harmonics will hit the filter passband (which could be 50 ..
200 kHz wide with 500 kHz reference oscillator). The absolute
frequency of this VFO does not matter, since any drift is cancelled
out, provided that the phase noise levels are decent and the frequency
remains within the filter passband.

In this way, it could be built with only tubes without any ICs.

Hi,
Has anyone out there used a DDS as a programmable divider
in a one loop synthesiser ?
It would seem to me an easy way to build a 45-75 MHz or 70-100 Mhz
synth.

Is it a problem for the DDS that it will have a variable clocksignal ?

How many clockcycles does the DDS need to stabilise after a change in
the clock frequency ?

Any ideas ?

Mikael

Use the DDS to provide the reference signal into the PD, for fine
tuning. Use a programmable divider for coarse tuning.

I dont think the variable clock will be a problem
I have seen this idea as a "fractional N" synthesizer
You could put the output through a bandpass filter around the
reference frequency for the PLL to get rid of spurs from the DDS
before applying to the phase detector

An outstanding idea - I'll give it a try. I'm somewhat concerned about
noise and junk from the ref oscillator modulating the VFO though.

This is exactly how the old Racal RA-17 and successors did it. What scared
me off of this was the huge amount of BP filtering but as you pointed out
this can easily be solved using 45 MHz mobile phone xtal filters.

Thanks for the comments, guys! 73 John

Hi Leon,
Do you mean that there could be a problem with my approach ?
Any idea what the problem could be ?

The idea was to get rid of the programmable divider.

Hi Richard,
Yes, that was what I had in mind.
I guess I will not know for sure until I build it and try it out.

Thanks, its the living room and I have removed the batteries from everything I can find. Its now been going 18 hours and seems to be getting louder.... or my ears are just getting tender. If its battery operated hopefully the battery will die before I get home tonight.

Thanks, only one smoke detector (whose tone is much lower) and it has no battery, its wired into the house. When I killed power to the house it chirped about once a minute for 10 min or so then stopped, probably has a cap in it.

That would be really strange, U/L requires a battery. Let me suggest you take another look at the smoke detector. The low battery alert is normally a high pitch. The Loss of power chirp is lower pitch and does as you have noted. At least replace the battery which it has to have. Mine plug into house power as well, and I have got the exact same thing you describe.

How about a gas fireplace log. For it to be making noise, something has got to be powering it.

I went crazy with a "buzz" that came from the refrigerator every 60 seconds or so. After two days I finally discovered that the son-in-law had thrown his vibrating pager into a basket full of misc junk on the top of the refrigerator.

No, the only solution I can think of is to have the phone company
ensure the phone line is grounded appropriately, and the farmer's
fence is properly installed (insulators all clean and tight, no brush
touching the fence, ground rod is secure...).

Seems like manufacturers have dropped a lot of varicaps from their lines. Looks like a Philips (www.semiconductors.philips.com or possibly Infineon (used to be Siemens) part number, but their sites don't mention the 109 now. A list at http://www.calpedel.it/diolst.htm shows it, apparently, as a 30V 4.3pF to 32pF diode with 0.5 ohms (series) resistance. Maybe that helps a bit...

Cheers,
Tom

(Wondering where I can find some ~500pF varicap diodes at a reasonable price...)

Really!...not in Canada, one can guess why the restriction though...I think it's the Clipperton linear amp that has a choke in the final to prevent transmission around 10 meters somewheres (maybe the whole band?...)

How about a low-tech detector? High pitch sounds are very directional;
try plugging one ear and listening with the other thru a toilet paper
or paper towel tube and start scanning the room.

Several years ago, I had a buzzing wall -- turned out to be a bee's
nest between the outside stucco and inside drywall.

From the Summer 97 Cirkit catalogue:

BB109 replaced by BB809.

Vr 28V, pF/V (typ.) 2.8/28. VHF AFC. As Tom Bruhns suggested,
try the Philips website - there's a link on my web page (below).

3904. Learning Circuit Design

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-28 00:00:00 UTC
From: Chuck Schofer <cschofer@yahoo.com>
Message-ID: <3A243F72.3D383BB9@yahoo.com>
Source record: 56388

Is there anybody on this list who can point me to a person or a tutorial that will teach me how to design useful circuitry? I guess my ultimate goal would be to design and build my own radio (or something possibly even more sophisticated), but right now I'd settle for a simple project such as designing a circuit that makes an LED blink.

Believe it or not, I already have much of the theory under my belt such as Ohm's Law, as well as the general operational concepts of inductors, capacitors, diodes, and transistors. However, I am having some trouble grasping the concept(s) needed to put it all together.

I have already made attempts to contact people/clubs in my local area. Everyone I speak to tends to be friendly and willing to throw in their 2 cents, but the reality of the situation seems to be that nobody really knows much about the subject (or if they do, they are keepin' quiet).

Help! Thanks!!!!

Chuck, KB3FKH

Lets take your first project, blinking a light. You have stated you know ohms law and capacitors and resistors.
Your mission should you choose to accept it is...

Lets take a small neon bulb a cap and a resistor and a battery or supply voltage capable of lighting the bulb. if we were to hook the resistor in series with the cap, we know that we can determine the rise time of the charge across the cap. Now what if we put the bulb across the cap. The cap would start to charge. When it reached the firing potential of the bulb, the cap would discharge through the bulb lowering the voltage to the point the light would go out. This is the basis of a simple RC oscillator. You should be able to build a circuit and predict the blink rate. At that point holler and we will set you up with your next mission!!

Yes, I know something about Ohm's Law, capacitors, and resisitors... but that doesn't mean that my knowledge is complete. :-(

With that said, I understand that it will take some period of time for the capacitor to charge to the voltage of the battery. My memory is a bit fuzzy on some formulas, but I think that is the RC value??? But once the voltage across the capacitor reaches "critical mass", what is going to stop the circuit from achieving a "steady state" situation? In other words, I can see how it will take some period of time for the capacitor to charge up and for the bulb to light, but I am not sure I understand how the bulb will totally discharge the capacitor. Does the neon bulb become a short circuit? How would you design the circuit using an ordinary flashlight bulb? Would you need a diode between the capacitor and the resistor?

Hi everybody,

I have accumulated over 700 tubes! Way more than I can use. I'll trade tubes I have for tubes you have, other junk box goodies you have, or even digital/computer materials. I am reluctant to sell them outright because the market value is pretty vague. Are these worth a bazillion bucks on ebay or only a few cents at a hamfest? If you need some I guess they're worth trading for and paying the shipping costs.

So... whatcha got?

Email for list (until I can set the inventory up on the web).

Bill KU8H

Go back over your laptop's docs. If there *is* a NUMLOCK key,
there's some sort of 'weird' assignment of keytops.

On mine it is the 'stagger' of

7 8 9 7 8 9
U I O for: 4 5 6
J K L 1 2 3
M 0

Not very convenient, I'll grant you!

Jonesy

FWIW, I believe the National Radio Company HRO-500 worked this way. You might want to study its design. The QST product review of it explained the architecture.

Most laptops do have a numeric keyboard. They are a subset on the
regular keys. To get the extended ASCII on mine you use the function
key + the alt key.

Hi, I have a high pitched tone in my house that I need to find. Anyone know of any kits, schematictics etc? I know what room its in but thats about it. It's bad enough we may stay in a hotel. I have tried the usual stuff, turned off power to the house for about 20min, turned off the gas and water no change. Any ideas or suggestions of where to look for them welcome. This has been going on for 6 hours and its driving me nuts!

Thanks in advance for the help (and it will make me look good with the family if I can fix it).

BEC (formerly Bonex). Their complete TOKO catalogue - which contains many useful items Cirkit never told us about - is at www.bonex.co.uk

BEC also stock a range of other components, and are easy to deal with by mail order.

Amatuer Radio Handbook is a very good place to start. Read it, front to
back. It quickly gets to useful RF circuits. Something like an
introduction the RF (radio freq) Circuit Design is what your probably
looking for.

This works because a neon bulb requires a higher voltage to initially "fire" it than it does to keep it lighted once it has started. The resistor value has to be large enough that it won't permit enough current by itself to keep the bulb lighted. The capacitor voltage gradually rises as it charges through the resistor until the voltage is high enough to fire the bulb. Once lit, the bulb takes current from the capacitor, gradually discharging it until the voltage drops low enough for the bulb to go out - then it starts all over again.

You could apply the DDS as the reference oscillator for the PLL and
tune it over a narrow range. For coarse tuning use the main loop
divider instead of the DDS as a divider. Both schemes would work
similarly I think. However with the second scheme you could choose a
"sweet spot" on the DDS range with low amplitude spus. In both cases
you could clean up the DDS output with a BPF (say a crystal filter) to
improve wideband spurs (I havent tried any of this!)

Once I though to use DDS as divider, picking just the MSB of the output.
However, this would work ONLY for low output freqs., otherwise the jitter
on the MSB is heavy. Of course, if you generate the analog sine, filter it
as usual, and
then pass it through a sch.trigger, it will work...

3920. Software "atomic" clock

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-29 00:00:00 UTC
From: jflanders2@home.com
Message-ID: <3a2520d3.602829703@news>
Source record: 56307
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.digital,rec.radio.amateur,rec.radio.amateur.homebrew

The "atomic" clock you can buy at radio Shack reads one of the LF WWV transmissions and decodes the time info imbedded in it to keep itself corrected.

Anybody written sound board software to extract this time signal from the output of a radio tuned to that same WWV freq?

Sure would be nice to have an "atomic" clock in the PC.

Jerry W4UK

3921. Good Used Test Equipment

I have a lot of REALLY GOOD USED TEST EQUIPMENT for sale, VERY reasonably priced, at

http://www.fullnet.com/u/tomg/gooteesu.htm

I have lots of Tektronix oscilloscopes of all types (JUST GOT 33 MORE!), lots of 7000 and 500 series plug-ins (JUST GOT 50 MORE!) and mainframes, Tek manuals, lots of Hewlett Packard (HP) equipment, General Radio items, and many other manufacturers' test equipment and accessories, including some tube tester units, curve tracers, spectrum analyzers, noise/distortion testers, signal generators, meters, power supplies, etc. I also have a varied selection of new electronic components and used vacuum tubes/valves.

The equipment is all inspected and tested (by an electrical engineer (me)) in detail, and working, before being sold. Cleaning and minor repairs may also be done. ALL EQUIPMENT HAS A MONEY-BACK, RIGHT-OF-RETURN GUARANTEE. Any defects or problems that I can find will be noted in each item's description.

I accept credit cards (through Paypal (it's free)), money orders, personal or company checks, cash, gold, ...

Don't like my prices? NO REASONABLE OFFERS WILL BE REFUSED! Please, take a look, right now.

Thanks, very much.

You might think about a soft-shell laptop PC bag. They are pretty cheap,
include the hardware you'd want and could be cutdown and re-sewn to the size
you need, although you'll need an upholstery sewing machine because the
stuff's pretty tough.

The contact information is in every ARRL Handbook published in
at least the past 20 years.

I had a look in the TIS database at http://www.arrl.org/tis/
(a handy reference for many things) and found them in seconds.

Most of the information you need is the ARRL Handbook. I find this
book is just too big to use as a quick reference book. I often spend
twenty minutes looking for information that I know is in there.

If you don't have a copy already, buy Solid State Design for the Radio
Amateur (ARRL).

Most important of all, plug in your soldering iron and build something.
To learn to design circuits that work well, first you must build a few that
don't work at all :-)

What radio are you talking about? You would need a radio and antenna that work at 60 kHz, and convert the modulation used on the WWVB signal to an audio tone in order to feed it into a PC soundcard. At that point, all you'd need is software. But is there a suitable radio for this?

Dave

Go to www.ananlogx.com and look under network tools. There is a program
called atomic timesync. set it and forget it.

I have an ICOM PCR-1000 receiver already hooked up to the PC and the audio is already fed into this PC's soundcard.

I think lots of guys would use the software. If a receiver were not already available, it should be pretty easy for homebrewers to cannibalize one of the existing cheap clocks to get the receiver and feed its output to the computer sound card.

C'mon, somebody, write it. Let it operate under Windows and let it set the PC's clock automatically and then reset it periodically. I am stupid, or I would do it myself.

I was trying to do a meteor scatter packet radio operation during the Leonids last week, in which I broadcast my packets during a prescribed 15 seconds of every minute (see http://go.to/BEACONet). My PC clock kept drifting so much I wandered out of my time frame after only a few hours. Lots of other applications for a precise clock in CW meteor scatter calling, etc, also.

The time signals are there, so why not be using them???

These should beep when batteries are low, not give a continuous tone.

The thing about tones is that they may not be where you are hearing them.

Yah, I know. Sounds strange, but the tone may be generated at one or more
locations and that particular room is a "focal point" or node for the sound.

It may come in on metal water, or gas pipes and could be associated with
either service.

You didn't say what frequency, but if it's very high pitched it's unlikely
that the sound would travel very far through the air.

When I was younger (could still hear high frequencies), the horizontal
oscillator from the the TV was really anoying.

We currently have a energy efficient refrigerator. That thing is loud. It
creates a high pitched tone (between 6 and 8 KHz.) There are several nodes
clear into the living room. When I was going to college, I got to
unplugging the thing so I could study.
```

It was one of those where it would be lound enough to be obnoxious in one spot. Move three feet and you could not hear it at all.

Good Luck,

Roger (K8RI)

Why do you want to use a soundcard?

Here in Europe the transmitter of choice is DCF-77, and many household
clocks for it exist. They can be bought for prices starting at the
equivalent of US$ 10..15 (for a battery-powered alarm clock)

The output of the receiver section already is a digital signal.
So instead of feeding this into a soundcard, one connects it to some
spare input (usually a status signal on the RS232 port).

Several programs exist to sync the PC time using this setup.

Who would want to tie up an expensive receiver for this?

Hello,

I'm wondering if any of you own and can comment on Cutting Edge Enterprises' "WorldPack" nylon protective travel cases for the IC-706 or FT-100. What is the quality of the craftmanship and does the case do a nice job as a carrying case for the IC-706/FT-100. Does the WorldPack give good access to the IC-706/FT-100's hookups? Power cable, mic cord, ext speaker?

thanks!

Jason

Hello somebody - forgot to notice who, sorry!

I had a 2m 5/8ths magmount aerial standing on top of an LED clock
mounted in a diecast box; It took a while to locate a pure tone of about
800 Hz, perhaps, which turned out to be the aerial - set resonating at a
harmonic by excitation from the mains transformer. When I looked closely
I could see the vibrations.

To borrow a theme from an episode of the Dilbert TV show, I have "The Knack" when it comes to computers and software design, but not when it comes to electronics design.

Thanks to everyone who responded. I wish I would have thought of this method to find info sooner. :-(

It sounds to me like I should pick up a copy of the ARRL Handbook. Does this book contain specs on currently available components?

One problem I have is that I understand the general concepts, but I have trouble applying them in the real world. For example, I found a tutorial on www.qsl.net that, among other things, explains how current would oscillate between a perfect capacitor and a perfect inductor. I understood that perfectly. I also understand that there would be losses in such a set-up due to real-world resistance/impedances in the wires, etc., that would cause the oscillation to decay over time. Just as would be the case with a person on a swing, I understand that it is necessary to give the circuit a gentle "kick" from time to time to sustain the oscillation. But how do I give the circuit the kick it needs?

Referring to the other branch of this thread I started, a few people told me that I would need a transistor if I used a flashlight bulb instead of a neon bulb (which apparently becomes almost like a short circuit at the flash point). I understand that a diode only allows current to flow in one direction (unless the reverse voltage exceeds some "magic" threshold) and that a transistor is almost like to diodes back-to-back, but I am just not making the connection of how a transistor will help. Help!

Doesn't CHU (3330 kHz, 7335 kHz, and 14670 kHz, Ottawa?) transmit time
standard data as Bell 103 standard FSK on AM? There are lots of hardware
construction articles and software out there to easily decode this data
stream.

Nowadays, people also use GPS sattelite signals for time standards as well.
I believe there are sync error tables published on WWVs web pages somewhere.

Chuck, there have been some pretty good ideas floated here so far. The Handbook has been mentioned over and over and it's an absolutely required resource. But I think what you need to do is just do it. Let me share the path I've taken the last year or so.

First and foremost, tho, get a copy of pspice (free) and learn how to use it. K7QO has some good stuff on his web page, but like so many things, you just gotta dive in and stub your toe a few times. When you are building anything non trivial, there are interactions that happen, and lots of times, unless you are some sort of prodigy, there is stuff you just won't get so easily. With pspice you can model the circuit and see how it behaves. It's a lot quicker and more informative than committing something to copper.

You should, however, actually build a few of the things you model. It's important to build the confidence that when you come up with something in pspice you can actually make it work.

The next thing I did was to take on a significant homebrew project. In my case, it was the 2N2/40 of Jim Kortge. This is a really great rig, and it's a significant, but not insurmountable, project. I got some help from Jim, and some from some local folks. But the big advantage here for me was that I'm maybe a little impatient, and have a tendency to make mistakes, and I have virtually no test gear. Whenever a part of the circuit didn't work (which was often), I would have to sort out how I was going to make the measurements to figure it out. Since basically all I had was a working rig (an Icom 706) and a DMM, almost every measurement meant building something to make the measurement. Nothing complicated, but with a little thought you can measure anything. Well, sometimes a little more than a little thought <g>. Yes, it was a struggle. Lots of times I resorted to modeling parts of the rig in pspice to see if the behavior I thought I was seeing made any sense. It probably took me close to 6 months, but at the end of the day, I had a really nice rig and a much better understanding of how this stuff works. And perhaps most importantly, a degree of confidence.

The next thing was to completely build a rig from a clean sheet of paper. The incentive here was to get a simple, low cost circuit with another local ham (who also happens to be a great designer) to get some code practice. Our design point was as simple and cheap as possible.

We ripped off most of the transmitter design from the handbook, but for the receiver, we studied a number of rigs. The 2N2/40 of course, but also the

Red Hot/Norcal NC-20, the SW-40+, and the SMK-1. All of these have schematics available on the net, and all have some sort of discussion on the net of why the designer made the choices he did. There is a lot of common stuff in all these radios, and a lot of differences, too. Once we understood what the experts did, we designed our receiver. We built two, each of us had our own flavor to it, and had QSOs. We are continuing to do some tweaking, tho the other guy has since gotten a real radio, so the original objective is gone, but we keep having to try better ideas. BUT - we did get on 15 meters for under $20 - transmitter and receiver included. (I've promised Doug Hendricks that I would write this up for QRPp, and hope to get to that over Christmas.)

Most recently I built the code reader that IK3OIL had in the 8/99 QST. Well, I say it was his code reader, but I didn't consider for a minute duplicating his circuit. His basic idea, sure, but I got my hands on a really nice LCD that was a little different, I didn't have a 567 laying around, so rather than wait to order something, I just used what I had. So it's -my- code reader. And it will probably get tweaked a few more times before I get tired of it. But all along the way I'm learning stuff.

This stuff really isn't that hard, but to do it, you just gotta do it. And it helps a BUNCH if you can sucker someone else into getting interested in it as well. It's really great to sit down with someone else and discuss why Fifield did this in the NC-20, but Benson did this other thing in the SW-40. After a while, you really get to understand what they were thinking.

Oh yes, and subscribe to the QRP-L reflector, too. This is an incredible source, and all the guys who really know their stuff hang out there.

I hope this helps - just go melt some solder!

Ok. Does the PCR-1000 tune down to 60 kHz? When you tune there,
what does the signal output look like? The PCR-1000 has a number of
demodulators available (FM, WFM, AM, SSB, CW..) but the WWVB signal
almost certainly doesn't use any of those modulation schemes. Does
the PCR-1000 give a decodable signal out anyway in any of those modes?
And, if so, is the signal actually an audio signal that can be digitized
successfully by a sound card, with its limited frequency response?
These are the kind of details that determine whether this is possible
or not.

>C'mon, somebody, write it. Let it operate under Windows and let it
>set the PC's clock automatically and then reset it periodically. I am
>stupid, or I would do it myself.

There's another possibility, too: just about any board-type GPS receiver
outputs the current time and a pulse each second, accurate to a microsecond
or so. This can be used to keep a PC clock quite accurate, and there's
software available for this. If you only want accuracy to the nearest
second or two, any handheld GPS receiver with NMEA output will do.
See www.tapr.org for suitable hardware and software.

Dave

The other option is to bring up the Character Map application (in Accessories). You can then search for the character you want. Click on the character, then click on Select, then Copy. The character is now on the clipboard, and you can paste into your main application. Slower, but works fine.

Hi Chuck.

If you are very intuitive, pretty much all that you would need ,for some basic circuit design, is in the Amateur Radio Hand Book published by the ARRL.

If you dont happen to be one of the few, who have sufficient intuition about the subject, to gather what you need from this book, you will most likely need some level of formal training as well as experience.

Most professional Electronic Techs and Engineers get anywhere from 2 to 4 years of formal training, and even then, some are not ready to design circuits.

Subscribe to some good magazines, such as QST, Popular Eectronics or QEX.

Lots of good web sites with build it projects for amateur radio interests. Look at some of the circuit schematics and see if you can figure out what makes it tick.

Here is a site that has links to all sort of projects.

http://www.qsl.net/k9gdt/radio/bldlinks.htm

Applications manuals from the various semiconductor manuals are a great source of information.

Radio shack has several books that have homebrew project, including a 555 timer circuit that blinks an L.E.D.

Thanks for the info, I found it in one of my kids toys, must have lifted it up 3 or 4 times, those high pitched noises are tough to locate. If mine has a battery it will never be changed as its about 10 feet above the stairs (one of those stupid valted ceilings). the house is about 10 years old so maybe the rules have changed(or maybe Im wrong, wont be the first time or the last). Thanks for the help.

Thanks Don, I actually tried that with a short piece of pvc. It didnt seem to help. I also tried attenuating the signal with paper in the pvc. This was pretty loud. I finally found that it was one of my sons toys. After opening it up it looks like the battery voltage dropped enough to emit this squeal.

Thanks for your help. It would still be interesting to build a audio direction finder. This was pretty high, it didnt pass through the telephone.

Any way thanks for the help.

Art.

Hey I found it! One of my boys talking book toys turned out to be the culprit. I picked it up to put it away and the noise moved with the book. After pulling the batteries the noise stopped. I havent been able to get it to repeat so far. I may fiddle with a mic and simple amp circuit to find something like that if it ever happens again.

Thanks for all your help. cul Art KF7GD

The ARRL handbook is a good starting point
Other good books are
The Art of Electronics By Horowitz and Hill.
Introductory circuit design test books such as
Circuits Devices and Systems by Ralph J. Smith. You can try a used bookstore near a collage that has an electrical engineering program to keep the cost down on this type of book

Solid State Design for the Radio Amateur
(ISBN: 0-87259-040-2) and
Introduction to Radio Frequency Design -- by Wes Hayward, W7ZOI
(ISBN: 0-87259-492-0)
are some other good books for serious design information, but I suspect that you are after something more basic at this point some other books to consider are the text books used by community collages for the electronic technician programs.

In general I would visit the public library and the larger bookstores looking for books that describe how circuits work. If you understand how circuits work then initially you will take those circuits and calculate new component values to adapt them to your application. A great deal of design is done by engineers and experimenters by taking basic circuits, tailoring them to the specific application and combining those circuit blocks together to form a system (receiver) that performs the function that they want. You will want to have a collection of test equipment so you can test the circuits that you design. Until you get very good you can expect that any thing beyond the most basic circuits you design will not work correctly the first time so you need to have the equipment to find out what part of the circuit is not behaving as expected. You then need to understand why, and this can be the most difficult part. Generally you review the characteristics of the components in that part of the circuit looking for what characteristics you missed or did not fully understand. As you learn the characteristics of various components you will be more successful at designing circuits. To be very successful at designing analog circuits you need to be comfortable with solving algebraic equations and analyzing other peoples designs to understand how they work.

Basic equipment
Multimeters, at least 2. One digital and one analog. Be sensitive to there limitations.
Variable power supply. This you can build from an article.

Depending on the specific area of interest other equipment is desirable
Audio signal generator

RF signal generator
Oscilloscope
There are probably a variety of other pieces of equipment that would be
useful depending on your level of sophistication and your pocket book.

Fixing broken electronic equipment can be very educational forcing you
to analyze how a circuit works, but you need to be watch out about
getting in over you head in problem that you do not have the knowledge
or equipment to fix. Old equipment without microprocessors are much
better candidates for this.

To understand how a neon bulb based blinker works you need to understand the characteristics of a neon bulb. An exercise for the student is to look up the starting voltage, sustaining voltage, sustaining current, and maximum current. These all and possibly other parameters affect the design of such a circuit to blink a neon bulb.

Most designs a circuit to blink an LED or incandescent lamp will require one or more active device such as a transistor although other approaches such as a relay or thermal sensor could be used.

Possibly a tiny HV arc. Turn the lights off and see if you
can see it. Sometimes just moving the HV lead around will
cure that...with the set off, of course.

Both WWV and WWVH broadcast time/date signals continuously on HF. Listen
to them using a receiver with decent low frequency audio output. That
low frequency tone (sorry I don't remember its frequency off hand) that
starts exactly on each second pulse and lasts for a fraction of a second
contains the code. The longer tones are 1s and the shorter ones are 0s.
These are the tones that the famous Heathkit Most Accurate Clock used.
Should be no problem at all to detect and decode them with a sound card.

In the old days, it used to come from the horiz flyback transformer most
often. But that pretty well went away with the epoxy potting of them
that was used after people started to get upset about the tendency of
the wax potted ones to catch fire. Still, I'd look in that area and
maybe also at the deflection coils. My ears haven't been nearly good
enough to hear that stuff for years, so I'm not up to date, but I
remember how annoying it once was.

I had one where the epoxy wasn't holding or something. I squirted a bit of silicone on it and it stopped. For a couple years, I was able to whack the cabinet on the side and it would stop for awhile, but eventually that stopped working and I had to dig inside.

Does any one know where I can buy some resistance wire?
I need some to rewire 3 voltage dropper resistors
on an AC / DC, 1950's Ultra Coronation Two, wireless set.
Thanks Bob

Looks like that is for computers on the internet. the computer I am
using for the ham stuff is not on the internet. I already knew about
the internet time service. Thanks anyway.

Chuck, one suggestion is from a philosophical viewpoint, but it is also very true and applicable, based upon a lifetime spent working with all that "theory."

My point is to get the notion out of your mind that there are two poles to all this: "theory" and "real life."

Rather than being opposite ends of a stick - sorry, but no better analogy comes to mind - they are merely locations on a circle. And sometimes those locations are very near to one another.

Everything about electronics, physics, etc. that you experience in "real life" is a direct result of a body of theoretical understanding and knowledge that forms the basis for the real life devices that we use and enjoy.

As engineers and scientists we are careful to always keep one foot firmly planted in "the real world" since that is where the fruits of our labors will be enjoyed.
But, we try to never make a class distinction between theory and the real world.

On a personal note, if you are relying on what has been discussed on this topic thus far, you are not yet prepared to make any effort to relate "theory" and "real life." After all, there is little commercial need for blinking neon bulbs. <:}

But, several folks are making an effort to introduce you to some of the notions of electronics in order to encourage you to make the individual effort to study further. After many years in the electronics game, I can assure you that 99% of what you *really* understand and know will come from your own efforts at study rather than from courses, classes or the efforts of others.

I applaud your interest in all this - I don't know your age, but I see a lot of myself when I got so very interested in "radio" at the tender age of 14. That interest led to a career as an engineer and a lifetime (almost!) as a ham.

More power to you!

Dave, the signal is at 60 KHz, and is modulated by a 10 dB reduction at
a rate of one bit per second. You would need a frequency response down
to DC to use a sound card.

3973. Ramsey Kits 2M and 6M transcevers and receivers

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-11-30 06:27:22 UTC
From: Dwight Hebert <dwighthe@cox-internet.com>
Message-ID: <ermV5.31045$XQ4.574453@typhoon.austin.rr.com>
Source record: 56337

I just passed my tech license test and have been away from kit building for awhile. I'm thinking of building a Ramsey 2M or 6M transceiver or maybe a receiver if I decide to wait until I have my general license. Does anyone have any experience with Ramsey Kits good or bad? I'm concerned with reception, stability, and reliability.

If you prefer not to have your response in the group you can e-mail me at dwighthe@cox-internet.com

Thanks

I downloaded the font and installed it. Now my zero's are slashed!

Unfortunately, I have lost the ability to distinguish between

0 and ï¿½

They are exactly the same! I will never be able to read Norwegian
again! However, I couldn't read Norwegian before, so the impact
will probably be minimal.

Interestingly, some of the other programs I run that insist on using
fixed-width fonts, notably Not-GNU, don't recognize the font as having
that characteristic. I wonder if that's a Windows setup thing or is
there a bit set in the font file itself that tells everybody it is
is that way?

Basically a diode is all thats needed! Everything else
would be for calibration, etc. That having been said, its
much easier to use an old VTVM (or even a new DVM) and build
up a little diode probe.

I feel I should jump in here and STRONGLY emphasize that, unless you're extremely familar with electrical safety and the workings of television sets, don't attempt to service the set. Even with the set off and unplugged, a significant high voltage can remain present. The aquadag coating on the CRT envelope forms a very low leakage high voltage capacitor, which can store multi-thousands of volts for weeks or longer (I've seen one throw a quarter inch spark after a week of being unplugged!). While the energy capacity may not be enough to kill (or, maybe it could?), it may cause an involuntary muscle jerk which could compromise the integrity of the CRT envelope (e.g., It could cause you to bash your hand into the glass tube), and the resulting implosion can certainly kill if it happens to suck you in or propel a glass shard in the wrong direction (and, CRTs are exteremly fragile on the back side). Thus, if you don't know all of the safety precautions (which I won't attempt to cover here), then don't remove the back.

Dave

P.S. Standard Disclaimer: I work for them, but I don't speak for them.

Thanks to everyone who replied to me, either via this newsgroup or via personal e-mail. On everyone's advice, I bought a few books yesterday. The Radio Shack books were not all that expensive, but I now understand why one person recommended that I try to get a used copy of "The Art of Electronics." Man, that is an expensive beast! :-)

One of the recommendations made was to "just do it." Along those lines, does anybody know of a kit that contains a bunch of the transistors, resistors, capacitors, etc., that I might need to get started? I am thinking that it might help to have a stash of basic components to work with. I am not necessarily looking for those electronics kits that my parents bought for me as a kid. All they taught me was how to interconnect the springs.

Also... one recommendation was to get a copy of the ARRL Handbook. I plan to do so, but I was wondering: Does this book contain specs on various components? For example, I am sure it is probably not a good idea to run 100 amps through a LED. There must be something out there that describes the different parameters of different components.

I used the Ten Tec Triton IV model 544 for many, many years mobile CW and never had any shift or drift whatsoever. It was a great mobile rig, except it was "wide" (by today's standards) and had to sit against the transmission hump.

There was nothing in the 544 manual about shift/drift, and none was ever experienced.

For the 100mA series filaments? If memory serves I think it works out you need about 500-ohm at 5W so if you get stumped finding the wire why not use
1) a series of lesser wattage ww resistors or
2) a couple or more of standard 3W ww pots in series? You can strip out the main resistor section and discard the hardware if space is a constraint.
3) a series of truck 24V cabin lamps as dropper resistors. (really brighten up the old girl :)
4) wire from a suitable replacement electric fire bar or toaster element from an electrical service centre. (although with your lower ac mains supply voltages I guess they are using thicker wire than we get here)

Otherwise there are modern power transistors from TV technology which will do this with ease as emitter followers or switch mode driven (and heatsinked).

If its for a filament string, I'd recommend the series
capacitor route. Works quite well, no heat. There's a
website with a little dos .exe program that will give the
exact value based on your parameters...I don't have it's URL
handy, but if you're interested, I'll dig it out of the
bookmarks.

> is that way?

It's a property of the font, which a program has access to. For example, some of the outputs in EZNEC, like the tabular far field output, require a fixed font to be displayed properly. So when you open the "Set Font" dialog in this window, the program gives you only the fixed width fonts on your system to choose from. The property is surely embedded in the font file in some manner.

A 60KHz receiver is possible, of course. One needs to detect the 1pps 10dB signal reductions of the WWVB carrier, then validate and decode the 60-bit word that results into time and date, then set the PC. A 60KHz receiver would likely be dedicated to that function alone since it wouldn't suit any other service (except for NPL's MSF time service in the UK, which uses a different modulation scheme).

Instead, I suggest that you consider decoding the modified IRIG-H code that WWV and WWVH transmit on a 100Hz subcarrier of 5, 10 and 15MHz. Most communications receivers will pass that audio and a sound board could certainly be used to decode it. Again, the data needs to be decoded and assembled into time and date before a machine could be set to it. Unless you are privileged to get a solid WWV signal, you'll have trouble with noise and fades, and you'll need to validate the data you think you've received.

I chose to do the 100Hz detection in hardware. I built a PLL-based 100Hz timecode regenerator for this purpose and I wrote a tool that accepts the 100Hz data via a parallel port pin. The program is called TakeIrig.com; it is supplied with the RighTime evaluation package at www.RighTime.com. A corresponding timecode generator program, MakeIrig.com, can be used to test your setup. These are both DOS-based tools; although they work under Win9x if the data can get to them, Win98 tends to commandeer the ports and often defeats successful use of TakeIrig.

Good luck.

Chuck

"Chuck Schofer" <cschofer@capaccess.org> wrote in message
news:3A27CA25.20CC7D7A@capaccess.org...
> does anybody know of a kit that contains a bunch of the transistors,

I don't know of any kits that contain all the parts, but stocking the junkbox isn't such a bad idea.

Resistor kits are pretty reasonably priced at places like www.DigiKey.com or www.radioshack.com.

Capacitor kits, unfortunately, are kind of pricey. B.G.Micro has a capacitor grab bag that probably will have a lot of useful stuff and it's cheap. It will also almost certainly have a lot of junk. Alternatively, I would go to Dan's Small Parts and Kits and get what values I can get cheap, then fill in a few from Digikey. Unlike resistors, which are cheap and used in lots of values, you can usually get away with relatively few cap values for experimenting. Keep in mind that as you start to care more about how well the circuit works, there are all sorts of cap variants for a reason. But for experimenting, get what you can get. The Handbook tells you why you may prefer one type of cap over another, but in the early tinkering stages it doesn't matter all that much. For small values, the local radio shack has a disc ceramic assortment that is real good and pretty cheap. But you will want to augment it with larger values from someplace with lower prices.

For diodes, I would get a pile of 1N4148's from BG for a start. The 1N4148 will cover 90% of your diode needs for experimenting. They are $2.50/100 at B.G. If you start playing with mixers, you can go through a surprising number of diodes.

For transistors, the 2N2222 is cheap as sand and can go a long way toward filling your transistor needs. I found that having a few hundred of them on hand let me be real cavalier about toasting one, and they turn out to not be all that easy to fry. They are something like $9/100, $20/1000 at BG.

Also, you will want some 5 and 12 volt regulators. If you order stuff from Digikey anyway, they are cheaper for regulators than B.G.Micro, but not enough cheaper to warrant a special order.

For inductors, I would get a toroid kit from Dan's. A few T-6's & T-2's will cover 80% of your inductor needs, plus throw in a couple of FT-43's for broadband chokes. Toroids come in sizes and mixes. You should be able to get away with 50's or 37's - the number is the O.D. The bigger ones allow you to fit more turns so maybe are more flexible, but they are bigger <g>. The most common mixes are the -2 for under 10 MHz, and -6 for above. So a T37-6 is a 0.37" toroid for over 10MHz (but not into VHF). The ferrite

toroids are used for much higher inductances, and have an 'F' in the front. The most common mix for HF is the -43, so a FT50-43 is a 0.5" ferrite useful over most of the HF spectrum. If this is the only thing you end up ordering from Dan's, then get them from radioshack.com instead. Like the caps, as you zero in on something permanent, you may want some specialized inductors, but the ARRL handbook tells you how to turn the T37-2 into almost any inductor you need. Plus, they can also be turned into RF transformers.

> Also... one recommendation was to get a copy of the ARRL Handbook. I plan
> to do so, but I was wondering: Does this book contain specs on various
> components? For example, I am sure it is probably not a good idea to run
> 100 amps through a LED. There must be something out there that describes
> the different parameters of different components.

The Handbook has specs for the common stuff, but there are hundreds of thousands of components out there, so no one reference does such a great job. However, typing a part number into www.google.com will almost always turn up a spec sheet with not only specs, but application examples, etc.

Keep in mind, too, that stealing is a time honored tradition in electronic design. Virtually every device out there has large parts of the design swiped from another designer or from the manufacturer's spec sheet. Studying the schematics of other folks' designs is very educational.

hope this helps

I really should wait until April to send this but I really can't resist.

> Nick, WA5BDU ewrites about a high-pitched noise from inside his TV.

What you may be experiencing is a symptom of "dirty" electrons caroming off the sides of the feed lines which return them from the screen area of the picture tube.

You see, the TV is nothing more than a set of rapid fire automatic attack guns which send a stream of electrons to the screen to activate the color patterns on your screen. Over time, these electrons become coated with a residue of the phosphor they hit upon completing their trip to the screen.

When this happens, the trip they make back to the innards of the TV circuitry takes longer as they slow down due to parasitic drag and the deposition of part of the coating on the access hole to which the return wire attaches, usually on top of the picture tube and the circuitry inside the TV which collects this residue and responds to its deposition with a sound similar to that of a fingernail being drawn across a blackboard.

You really only need to go down to your local electronics shop and acquire some 99.99% isopropyl alcohol and some blue plastic-bodied Q-tips. Don't let the clerks anywhere sell you rubbing alcohol as it is only 70% ipa with the remainder being water which you don't want anywhere around electricity.

If you have the time, get out your wife's trusty vacuum cleaner with the long plastic tube and the round end fitting with bristles on it. Make sure the TV has been off for a while and remove the back cover. Thoroughly clean the inside of the set to remove the many years' accumulation of dust, grease and tobacco tars [if you smoke]. Replace the cover when the set has been cleaned thoroughly.

After you have acquired the Q-tips and ipa, turn on the TV and let it warm up thoroughly, at least 15 minutes. Now turn it off and remove the plug from the wall socket. Remove the back cover again and look for the wire coming out of the outside of the Picture tube. It is most likely red in color and easily visible.

A very important warning here: the inside of the picture tube is "filled" with a vacuum which is very toxic and can stop your breathing in a heartbeat should you free it to escape. During all phases of the following procedure you MUST NOT create an opening in the skin of the picture tube or the vaccuum will escape the confines of the tube and quite easily suffocate you.

First, you must remove the electron return connection to the picture tube. You do this by first lifting up the rubber gasket surrounding the connection to the picture tube and sliding your finger and thumb under this gasket until they make contact with the metal spring clips holding the return line to the picture tube. Gently squeeze the clips until they will come free of the indentation in the picture tube. Do NOT press them inward as you may puncture the skin of the picture tube and liberate the vacuum contained therein.

Once this return line has been fastened out of the way, take one of the Q-tips and saturate either end in the ipa and clean out the indentation until no more residues adhere to the swab. As stated before, do NOT press the swab inward with excess force as you may puncture the skin of the picture tube and liberate the vacuum contained therein. Once the indentation is thoroughly cleaned out, you can clean the the end of the return line.

After both the indentation in the picture tube and the return line have been thoroughly swabbed, reconnect the return line into the indentation. Place the cover back on the TV and be ready to be rewarded with a better pic ture, clearer sound and no whiney sounds similar to those recently given off by the Always A Bore. Or was that the Gorgeous Gee Gush?

If after reading this to your significant other he/she allows you within three feet of the TV for any purpose other than to retrieve the remote from on top of it, then whatever happens is a significant part of "survival of the fittest."

3995. Re: RF volmeter

Look in Ham Radio magazine, November 1987. There is a construction
article in there for an RF voltmeter that has a veyr wide linear range.
it compensates for a LOT of the non-linearities of the detector diode.

It is fairly accurate from less than 70 millivolts to 3 volts and can
probably measure even lower levels if one uses modern components to build
it.

Arcing is most likely. I had one where the flyback xfmr was howling with a hi-pitch. The only fix there was the axe(with power off, of course.)
The inside of the TV may also be cluttered with dust, which can also cause arcs.

Ok. Can you fax or scan the article
for me? I would like to see the
component selection and layout.

You have a nice scope. Do you have
a useful signal generator? I assume
that this is a broadcast band radio.
The TDA7000 just barely does the broadcast
band. It was designed for 47 Mhz cordless
phone work. Above about 100 Mhz, it
does better with a RF amp in the front
end.

Either the core of the flyback high voltage transformer, or,
more likely, the core of the switch mode power supply transformer.
If it is a North American Philips aka magnavox, philco, sylvania
and a few other, the switch mode power transformer singing is
almost a given. Can often cure it just with a whack on the core
with the plastic handle of a screw driver.

The ARRL Handbook has a limited amount of component specification information.
A lot of the specification information for parts that are currently in production are available on the web. Today that is one of the important ways design engineers get their component data information.
Printed copies of data books and data sheets are still useful for a few reasons. For me at least I am frequently building projects from parts that are in my junk box and the parts are out of production but just fine for what I am doing, so I keep a large collection of data books and data sheets in a file cabinet, and bookcase. These are even more important for component specifications when repairing old equipment.
I do not know where you live but in many areas there are amateur radio swap meets at least once a year. I frequent these as a good source of parts, junk equipment for parts and occasionally data books. In the amateur radio world there is a long tradition of salvaging parts from broken equipment and modifying obsolete commercial equipment for amateur applications.
For example there are few reasons to build a medium current regulated power supply form scratch. They can frequently be salvaged from discarded equipment and used as is or modified to meet your requirements. Building a power supply for the educational value is one reason to build from scratch.

Data books can frequently be obtained from the manufacturer for the asking by emailing the manufacturer or filling out a request on their web page.
A few of my favorites are
ON Semiconductor for discrete transistor data
National semiconductor for linear IC data
Texas Instruments for small-scale logic device data

Some of the specifications for neon bulbs can be found at the Chicago Miniature Lamp web site at www.sli-lighting.com/cml/index.cfm

I would collect a variety of distributor catalogs

Component vendors that cater to the hobbyist include
Digi-Key
www.digikey.com
Mouser Electronics www.mouser.com
Jameco Electronics www.jameco.com
Hosfelt Electronics www.hosfelt.com
TechAmerica/Radio Shack www.radioshack.com
JDR Microdevices www.jdr.com

I agree with WB8RCR?s suggestion of Dans Small Parts as a source of inexpensive component assortments. Several other surplus electronics companies also sell assortments and grab bags.
The Dans Small Parts catalog is online at www.fix.net/dans.html

There are a variety of surplus electronics companies that sell via mail order
These can be a good source for inexpensive parts

Alltronics
www.alltronics.com

Marlin P. Jones & Assoc. Inc
PO Box 12685
Lake Park FL 33403-0685
(407) 848-8236
(407) 844-8764 Fax

There are many more in each of these categories. Usually a little web browsing will turn them up.

A copy of the Allied Electronics catalog www.allied.avnet.com or the Newark Electronics www.newark.com catalog are good to have if you can get them. These catalogs are huge each around 2? thick. They can be difficult to deal with for the hobbyist, Allied Electronics has a $50 minimum order for all practical purposes, and Newark electronics adds a $5 charge on orders under $25. I order from them once in a while. I just accumulate a list of parts, tools etc. over a period of time to come up with enough things that I need from them.

I keep some old copies of these catalogs around because they are a source of some basic specification for parts that have since been discontinued.

The catalogs will at least give you the names of the manufacturers for a given type of part and then you can search for their web site.

The more advanced electronics books can be quite expensive. I checked and "The Art of Electronics" was $68 at amazon.com. But if you think that is expensive check out the price of some of the Filter design books such as "The Circuits and Filters Handbook" at $159.95. I was surprised to find that the "Electronics Filter Design Handbook" by Willians and Taylor was out of print.

I hope this helps.

Does anyone know what the RF field strength of an "average" home would
be-- that is, a house not near a radio tower or airport radar.
I'm just curious as I have built a field strength meter so sensitive at the highest gain it picks up the RF "background radiation" but I have no idea how much RF energy that really is.

Thanks.

For DCF-77 (77.5 KHz), which uses the same modulation (although I think
with fewer dB of reduction), special ICs exist that do everything with only
a ceramic resonator and an antenna (ferrite rod) attached. Serial digital
stream comes out of it, ready to be decoded by a resident program.

This can be found in the $10 alarm clocks I mentioned.

Can't you find something similar in the US?

It looks like most of the WWVB radio clocks, in fact, use 60KHz modules from - or copied from - Germany's Juergans. Some of them do not work well here in Florida, though, because of the distance to Fort Collins, Colorado, the transmitter location. For our office, I built a 60KHz oscillator, driven by a PC that produces the timecode, to keep a wall of radio clocks in sync and on time.

Message-ID: <bs9W5.4255$Ur5.459369@monger.newsread.com>
Source record: 56289

As an added note, if you make a fan dipole for 80 and 75...with one dipole cut for near the CW portion and one cut for the top portion it will/should show a low SWR across the entire band without having to use a line tuner.

I'd try to separate the ends at least 10 to 20 feet. Wider separation will actually show a less consistent SWR while the closer spacing tends to show a low SWR across the entire band. Not that it's flat, but flatter than running the antennas at right angles to each other.

I'd think the same would hold true for 160, but it would probably take more than two to cover the whole band.

I've use this approach on 75/80 for years, but not on 160 so I can only guess at how it would work.

There are too many circuits to understand them all as individual circuits.
May I suggest an alternate approach?
You have learned that a transistor turns on when the base to emitter
voltage reaches some value and a RC circuit will charge the C to some
voltage over time. Now you can turn the LED on or design a timer or....
Hope this helps. Enjoy (this is most important).

4011. Receommendation Needed Re. Transmitter Schematic/Kit for ROCKETRY APRS application - 2meter low power

Newsgroup: rec.radio.amateur.homebrew

Folks:

APRS application for High Power Rocketry

Can someone help or offer a suggestion for a suitable low cost, low power, small
form factor, battery powered TRANSMITTER to interface with a TNC and GPS rcvr?

I am interested in a small form factor, battery powered transmitter on
143 MHz for a High Power Rocketry APRS application.

There are a great many HPR enthusiasts who are exploring RDF packages for rocket locators. Some of us are investigating GPS/APRS in an effort to precisely locate the rocket after landing.

Some groups have kluged together platforms from HAM radio hand-talkie radios but I'm trying to find a capable transmitter kit/schematic without all the packaging extras.
http://members.home.com/jewen/construct.htm

Trxmtr <--- TNC <--- GPS rcvr <--GPS ant

Some one of you knowledgeable guys should be able to offer a suggestion or point directly to a suitable kit or schematics. Perhaps you'd even enjoy COACHING us in completing such a project.

Thanks very much.
Jim Sutton

4012. Getting Started

> expensive?

It depends what equipment you are talking about. If you want to design and build your own all band synthesized 100 watt HF rig, yours will probably not be as good as a "store bought" rig unless you are very experienced and well equipped with test equipment, machine tools, etc. It will also cost you more to build your own.

If you're talking a QRP transceiver or an accessory item like a keyer, you can do very well on your own. IMHO the best way to get started is with a kit. Try an Internet search on "QRP" and "KITS" - there's a boat load of them available, depending upon what you want to build. After you get a little building experience, Elecraft makes a couple of great QRP HF Transceiver kits (The K1 and the K2).

Source record: 56295

Grant,

I would encourage anybody with an interest to start homebrewing. Some of the kits might be a good choice to get started. With more experience you can expect to outperform commercial offerings in some respects.

One reason to homebrew is because there is no equipment on the market to do what you want. There is no way to compare costs here.

With experience you can expect to build your own stuff and have it outperform commercial equipment in some regards. Such equipment will not include all-mode, all-band tranceivers that will make all of your qso's for you and give you weekly reports about how much fun you are having on the air. You CAN make a radio set that really shines with no compromises on one mode and one band and in the manner that you want. There are many kits and scratch designs that fall into this category.

The cost? How sharp is your pencil? How much do you value your time? If your time is counted as free (it should be for a hobby) and you are careful you can save a lot of money. You can also spend more than if you store-bought your equipment.

I built a crystal controlled two-meter FM rig to operate on the local repeaters as a mobile radio. It transmits 5 watts high and 5 watts low power (5 watts on intermediate power, too) and even has a touch-tone mic and PL. It works on three repeaters and two simplex frequencies. I spent about 150 bucks on this. I could have bought a 10 watt programmable radio on the used market for less. How do you account for satisfaction? I made my radio myself and learned a lot. It still works well after ten years. I can leave it on for a few days and not run down the battery in my truck. The home-made case is so plain and ugly that nobody seems interested in stealing it... may not even know what it is.

The first radio I ever built was absolutely free (not counting my time). I made a 40 meter regenerative receiver out of a pile of trash. There were a couple of tabletop radios and a an old TV or two (all tubes, of course). I even re-used the wiring from the wrecks. The circuits came from books I found in the school library.

Just find a place to start and jump right in.

Have you tried winding a large ferrite donut with the fan leads? 2 or 3 turns CW on one lead and same CCW on other lead, 180 degrees apart. It should block the RF from entering, as well as cancel out any electrical noise created by the fans cycling in and out. Just a guess, I have never done this, but I feel it may be a quick fix and easily implemented

4021. Re: AD985x as a programmable divider ?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-03 00:00:00 UTC
From: W3JDR <j.r@usa.com>
Message-ID: <6csW5.1090$ul.55044@typhoon1.ba-dsg.net>
Source record: 56201

I've used the DDS lowpass-filtered sinewave as the variable reference to the phase detector in a VHF PLL. The PLL loop consists of VCO, fixed feedback divider to the PD, and a loop filter. Output frequency is N*Fdds, where N is the PLL feedback divider. It works very nicely. If you keep the PLL loop bandwidth relatively small, you get the frequency resolution of the DDS along with the spectral purity of the VCO (well, almost).

One of the important considerations is the circuit that turns the DDS sinewave back into a square wave for the PLL. Some PLL chips don't like external reference inputs that are too sinusoidal, so you have to restore the signal to a square wave before application to the PLL chip. If the external squaring circuit has too much gain (a-la high speed comparators), you will generate phase noise in the close-in spectrum.

4022. Morse Transciever

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-03 00:00:00 UTC
From: Phreeza <Phreeza@gmx.de>
Message-ID: <90djoo$38o$1@newsfeed.nordcom.net>
Source record: 56202

Hi,
Me and a friend want to build a simple transciever for Morse code, which is reasonably easy to assemble. If anyone has instructions or a site Containig them, please reply.
Thanx in advance
Phreeza

Dan's has some good stuff, a lot of it hard to get and all of it
attractively priced. The only problem is that the only way to order from
him is via snail mail.

Phreeza

Depends on how simple/easy <g>

K8IQY has complete info on a very nice (but maybe not so simple) radio on his site. For a very low end, single frequency rig, it's pretty easy to hack something together from a clean sheet of paper. I recently did that for code practice between me and another local ham. I don't have it on my web site yet, but will be glad to snail mail details if that's what you are interested in.

Will it meet the quality of manufacturer's equipment...

Homebrew gear will always be better than mass produced equipment. Quality is a subjective thing with many dimensions. When you homebrew something, you will do it to your specifications, so of course it will fit your needs better than something off the shelf. You will include features that matter to you, and will not include features you don't need that make the equipment harder to use. Of course, you also don't get to find out whether some feature you never thought of might be useful.

However, if quality in your mind has more to do with a pretty case, and perhaps very compact size (e.g. Icom Q7A), then homebrew stuff will be hard pressed to match the commercial gear.

In general, it won't be cheaper, at least for entire rigs. However, as another poster pointed out, this depends a lot on how much time and effort you are willing to spend. Also, you won't be able to buy exactly the same rig to your exact specifications, so an accurate comparison is difficult. For accessories, the improvement in price is often dramatic. Manufacturers face a lot of competition among rigs, so their price is often very close to the manufacturing price, which is often based on much better parts prices than you can get. However, they don't face the same competition for accessories. As a result, homebrew accessories are often an order of magnitude or more cheaper than buying the same thing.

Some examples I've built - Icom 706 tune control, parts $5, third party price $30; Icom CT-17, parts $10, Icom price >$100(!); CW display, parts $25, commercial (several sources) $70-160 none as 'nice' as mine <g>

On the other hand, I've only completely homebrewed two entire rigs. One, very nice cost probably $70 in parts, and similar commercial kits would be in the 70-120 range, although most lack some features important to me that are in the homebrewed version. The other is quite unique and as far as I can tell, there is no comparable commercial alternative. There is something similar in price/capabilities, but nowhere near the 'quality' as I see it.

It is going to end up a heck of a lot more expensive. You are going to get no P/X or resale value. $500 invested in a commercial rig brings maybe $300 sell-on price. The samre invested in homebrew gets you zilch on resale.

Having said that, keep on building! It is more fun and far more educational. Just don't be fooled into the idea that it is going to be cheaper.

4030. Pi Tank Network for PA's

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-03 00:00:00 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <90ekb6lcv3@plutonium.btinternet.com>
Source record: 56210

Dear NewsGroup Readers,

Now available for the use and entertainment of armchair PA linear designers. To professionals and amateurs alike, all at the same ridiculous low price.

******** Program PI_TANK.exe ********

Input data : Frequency, RF power output, peak RF plate volts, external load resistance, phase shift through network, Q of coil.

Output data : Values of C1, C2 and L, reactances of C1 and C2, resistance of plate load, efficiency, watts lost in coil, network Q, Bandwidths at the 1dB and 3dB points, network rejection in dB of 2nd, 3rd and 4th harmonics.

Usual facilities available for sweeping input data over wide ranges in fine increments.

Will unbelievers please note that the internal resistance of the PA device is not needed.

Program PI_TANK proves that the ARRL Handbook table of C1, C2, L values for PA pi-match networks are accurate to within +/- 10% or better.

Fully tested before issue. No beta testing in this house.

Only 44 Kilobytes. Download PI_TANK in a few seconds from website below. Run immediately.

Source record: 56211

http://community.webtv.net/w4th/4cx2504cx400a
Hello Builders! I am offering these subchassis assemblies which consist of 2 4cx250/4cx400a tube sockets, 2 chimneys, and two silver plated anode connectors.
These assemblies were removed from Collins made military equipment. They are very well made, heavy duty components.
The price on these sets is $20 ea. plus shipping.
The link at the top of this message will take you to a picture of these sub assemblies.
Also be sure to visit my tube pages below where you will find factory sealed 4cx800a tubes for $95 each, sk1a sockets for $39.95 and 4cx400a for $90 ea. These tubes come in the factory boxes, and are vacuum sealed in the original plastic shipping bags.
I also sell brand new Russian 811-a tubes for $20 each. These are brand new, and I just received them 12-2.
For you guys who have the Dentron MLA-2500 amps and are tired of looking for those expensive 8875 tubes which are nearly impossible to find, I am offering a MLA-2500 conversion kit.
The kit consist of one of the sub assemblies mentioned above, and a pair of Svetlana 4cx400a tubes. The Svetlana 4cx400a conversion for the MLA-2500 is one of the better, simpler, more powerful conversions offered for that amp. If bought separately, the sub assembly would be $20 and the set of new 4cx400a tube would be $180, or $200 total for the entire kit, but I am offering a package deal on both the assemblies and the pair of new 4cx400a tubes for $190.00.
If interested, please send me an email for more info. Also check my website at: http://msnhomepages.talkcity.com/tomstubes
I do not have the MLA conversion kit info on the website however.
I do have a wide selection of other Russian tubes.

4038. 457kHz transmitter

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-04 00:00:00 UTC
From: Jone <jt@nospam.kretze.no>
Message-ID: <90g0uubfg1@news.netpower.no>
Source record: 56217

I want to make a small 457kHz transmitter but I'm not sure how. I'm unable
to find a 457kHz krystal or one that can be divided by 457.
The divice I want to make is a avalanche beacon. It's battery powered and
transmitts a short 457kHz "beep" once each second.

Source record: 56218

I know this is getting somewhat off topic, but let's finish
the thread. The Triton IV can work mobile, but the protection
circuitry of the radio relies somewhat on the power supply.
If you run the radio mobile you loose some of the self
protective features of the radio.

Greg Knapp (gknapp@freshrain.org) wrote:

Great question. I have never thought about this before.
In the extreme case, a one bit converter can only supply
a square wave output, which is rich in odd harmonics.
Perhaps one of the serious engineers here can quantify
this for you.

4043. impedance for 5/8 lambda aerials vs frequency

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-04 00:00:00 UTC
From: LA8AK@online.no
Message-ID: <3a2ae659.55560690@news.online.no>
Source record: 56222

is some formulaes or program available to shown how impedance varies
with frequency?
Have some 80MHz antennas I would like to use for 6m array, and some
136MHz antennas I would use for 2m.
I suppose it is not only neccessary to add a series capacitor or an
inductance, but what is the real impedance then?

4044. RCI-2970 CTCSS-HOW???

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-04 00:00:00 UTC
From: Adam Huber <kd6sri@yahoo.com>
Message-ID: <3A2BCA7D.74F11BB8@yahoo.com>
Source record: 56223
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment

I have a Ranger RCI-2970 10-meter mobile. I purchased it used and I do not have the manual for it. I know how to make the unit do repeater offsets, but how do I make it do CTCSS tones? Are CTCSS tones an option or modification? All the 10-meter repeaters around here use a CTCSS/PL tone (most use 103.5).

Thank you,
Adam Huber

You should be able to figure this sort of thing using the demo version of EzNec for Windows, free from www.eznec.com. If you'd like a set of graphs that cover a range of diameters and lengths, I'd be happy to email to you a .pdf file that contains a section of the "Antennas" chapter of King, Mimno and Wing, "Transmission Lines, Antennas and Waveguides." The section covers center-fed doublets from zero length to a couple wavelengths, with graphs of resistance and reactance in various formats. By implication, the same info works for monopoles over infinite ground planes, where the impedances are exactly half what they are for doublets. The file is close to a megabyte, so let me know if you'd like it. -- Reg Edwards also has some programs free for the downloading that should answer these questions, too, I believe.

Cheers,
Tom

4047. Re: 160/80 m. antennas with single cable?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-04 00:00:00 UTC
From: Art Norman <artn@xetron.com>
Message-ID: <3a2bfe93$1@news.xetron.com>
Source record: 56226

Which reminds me of a Ham Radio article (mid 70s?) by a K4something guy I
think in Tennessee. It described several
versions of crossed long wire antennas each version longer
and covering more bands. He didn't mention any details of
the balun - 4:1, 2:1 ? I'd love to have a reprint - I'll pay mailing
costs. They were several 1/4 wavelengths long and I never
had the real estate to put one up till now.
Thanks,
Art Norman - N2ERI

I have to second the suggestion to go with TenTec. I built the TenTec 2m transceiver and the result is outstanding. They were also very helpful on the one occasion I had a small problem. I use the rig every day, with excellent reports.

Unfortunately, I've heard very few positive comments on the Ramsey transceivers. I troubleshot one of the VHF receivers for a friend, and wasn't very impressed with it's performance.

It is true that push-pull transistor PA's can be exceedigly wideband by using a high-permeability ferrite output transformers.

As ferrite mu and loss-factors improve so does the bandwidth.

But it will always be necessary to follow up with an LC network, even if only in the form of a low-pass filter.

Source record: 56236

Hi all,
Here I was replacing the o ring drive in the control box for my Kenpro kr1000 rotator and notice that one wire has come dislocated from the pcb.Now after many an hour looking for my old manual and visually looking for where the wire has come from ,both of which has proved fruitless.
Can any one help me out with a schematic or an exploded diagram of the kr1000 ,the whole manual would be great but beggars cant be choosers.
Thanks in advance
James

Micheal,
Try www.packetradio.com for an opto isolator interface that works FB with a minimum of parts. Buck has a radio specific section for PSK interfaces. There is an interface that uses the parts available from Radio Shack that uses a MPS2222a switching transistor. This type can be found at www.qsl.net/wm2u/interface.html They both cost about the same to build and are both fairly simple. I have used both and build both for some of the Hams around here in JAX FL.

That must be a pretty clean class-A amplifier if it will attenuate the
100, 150 and 200 MHz harmonics by 60 dB when operating at 50 MHz :-)

I would imagine a 555 timer chip would work just fine at 457KHz. I've seen
paperwork on how to modulate it in the timer Cookbook. Put it into a
simple tank circuit and out the door to an antenna. You'd be on the air...

cheers

... I'm sorry but I really have to take issue with this. The typical oscillator can used in digital/computer systems has, at best, a 50ppm tolerance. I would certainly not call that a "good" standard. I assume the 8640B/opt323 at least has a counter, and the timebase for that counter is undoubtedly capable of quite a bit better than 50ppm when it's warmed up. If I remember correctly, the opt323 deletes the phase locking, and if that's the case, of course the osc will drift some. I've heard of folk adding the circuits to do the phase locking, and that seems worthwhile if you want good stability over time.

If receiving WWV is a problem, one might consider seeing if Douglas Dwyer (who has posted here in the past, I believe, or at least over on sci.electronics.design) still has inexpensive surplus high quality oscillators available. A "deja" search should find him easily. According to what NIST publishes, you shouldn't count on doing better than about 0.1ppm with WWV, but my experience with an 8640M (with oven-controlled oscillator) is that it's not stable to much better than that anyway.

Cheers,
Tom

4073. Good Results With HB FET Power Amplifier

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-06 00:00:00 UTC
From: k3ky@erols.spamnocom
Message-ID: <90m6g1$h0h$1@bob.news.rcn.net>
Source record: 56107

I just got back into home building after about a 4 year
break during which the computer pretty much took over. :o)
I have not been much of a QRP op over the years, but I have
been having a lot of fun lately with a 1 watt rig I built back
in 1982.
I just built myself the WA2EBY FET power amp from
Mar/Apr 1999 QST and am really happy with it. It is nice
to have the greater stage gain that FETs can provide.
I think this one is a 'keeper'. I would be interested in hearing
accounts from others who have built either FET or bipolar
amps in the 'shoes for QRP' power range- technical details,
lessons learned, and on the air experiences.
73, David K3KY

A brief writeup on my recent experiences with QRP and
the WA2EBY FET amp:
http://www.angelfire.com/md/k3ky/page60.html

I have a Yaesu Ft101ex with speech processor, AM filter, xtals for 160 thru
10 -- plus 17 meters (I used 10C for the custom 17 meter xtals) !!!!!!
Also have the SPECTRONICS DIGITAL READOUT and the FTV650B 6 meter
transverter with a 2201 (6146B) final . Copies of all manuals AND the FT101
FACTORY SERVICE MANUAL. Some FOX TANGO articles. No manual for the readout
(IT works great -- I
like it better than the FC601 - it has the built in sideband offset) I do
not wish to break the rig it up !!! Everything is in very good condition
and
EVERYTHING works fine. The leather handle on the 101 is dry
and the cord on the readout has a piece of tape on it.
Asking $ 430.00 for everything --- buyer pays shipping.

Get it before it goes on EBAY !!

Pics available -- about 1 megs worth. !!

Stancor modulation transformer.

Plate Transformer 1280VAC CT

FIlament Transformer 7.5VAC CT @ 24 A

Filament transformer. Osborne Electronic No 5642B.

Primary 115/230VAC 60Hz Secondary 6.3 VAC 20A

Amperite 115NO120 Octal Tube Delay relay

Amperite 115C2 Octal Tube Delay relay

Edison 501 Octal tube Delay relay

Audio output transformer. Triad-Utrad S-31A

Hal ST-6 and Hal RVD 1005 RTTY units .

Sony Reel Taperecorder Model TC-252D

HP 1311A High Speed Graphic Display.

HP 1333A Graphics Display

Kratos Model M112 CRT Graphic Monitor

Details below:

Stancor modulation transformer.
4"l x 5"W x 5"H with soldrerd tabs in top
Transformer enclosed in a square sheet metel case with mounting hohes
on top and bottom.
Solder tabs on an insulated bacalite sheet within the case.
Case is painted with a black wrincle finish.
Notes say that the transformer is good for a pair of 807s or 811s in
push pull.
Markings are "P", "B", "P", "0", "2000" indicating Plate , Plate, B+ and

2000 ohm output.
Asking $40

Plate Transformer 1280VAC CT @ unknown current.
I will measure current if you need it but it looks good for at least 1.5

amps (2000 Watts)
210 / 220/ 230 / 240 VAC input.
This transformer was used to power a pair of 4-450TH in a class C Wilcox
transmitter.

5 1/2"W in x 6"L x 8"H .
Sealed case with mounting Flanges on connection end.
Connection through porclean posts with solder tabs.
No dents or dings but could use paint to make it look new.
Useful for 4-1000 Amp using a doubler.
Asking $75

FIlament Transformer 7.5VAC CT @ 24 A
210/220/230/240 primary.
This is a mate (similar) to the above in a sealed square case wieth
connections and mounting flanges on the bottom.
No paint required and specs clearly visible.
useful for 4-1000 Amp.
Asking $50

Filament transformer. Osborne Electronic No 5642B. 115/230 VAC 60Hz
6.3 VAC 20A
4 in L x 5 in W x 6 in H sealed square case with #10 mounting holes on
bottom.
Outputs are soldered post on primary and threaded posts on secondary
both on bottom.
Shield between primary and secondary.
No insulation rating.
Asking $30

Amperite 115NO120 Octal Tube Delay relay
115 VAC heater , Nornally open , 120 sec delay
Useful for Collins 30L1 Amp?
Asking $10

Amperite 115C2 Octal Tube Delay relay
115 VAC heater, Nornally closed, 2 second delay?
Asking $8

Edison 501 Octal tube Delay relay
115 VAC heater, Normally open , 45 Sec delay, 3 amp @ 150VDC or 250 VAC
contacts .
Asking $8

Audio output transformer. Triad-Utrad S-31A
15 watts 30 - 15000 cps
4, 8, 16 ohm out. 8000 ohms plate to plate input, 40 ma DC per leg
Asking $12

Hal ST-6 and Hal RVD 1005 RTTY units .
Do not have Hal Keyboard but could include a parallel keyboard.
Asking $75 for both.

Sony Reel Taperecorder Model TC-252D
Uses 1/4 inch audio tape up to 8" reels.
Plays / Records at 3.75 in (9.5 cm) or 7 1/2 in (19 cm) per second.
Stereo with separate record level meters.
RCA jacks with Aux in and line out.

1/4 in stereo headphone jack and 2 x 1/8 in mic jacks on front panel.
This unit would be used with an external speaker amp.
Also included is several reels of tape ....about 10 .
Asking $40

HP 1311A High Speed Graphic Display.
8 1/2 inches high x 11 inches wide.
5 Mhz bandwidth and 1 volt for full screen deflection on x and y.
1 volt blanking on z. P31 phosphor with phosphor protect
rear mounted BNC inputs with 10 K ohm < 40 pf or 50 ohm terminator
Without Front Bezel
Asking $115

HP 1333A Graphics Display
5" display area. Blue phosphor.
Asking $55

Kratos Model M112 CRT Graphic Monitor
Moderate speed 12" display with idential magnetic x and y amps for beam
deflection .
Z axis amp for intensity modulation and blank . unblank.
Open frame construction .
This unit is new old stock ...never used.
Asking $95

Above graphic displays useful for Economy Spectrum analyzer.

Buyer pays shipping from Cleveland, Ohio 44128

I too have an 8640B-323. Do you have any idea where I can find info on adding the phase-lock ciruit used in the commercial version?

Does anyone have a manual for the commercial 8640B who could copy the schematic(s) of the phase-lock circuit? That might be a good starting point.

I too have an 8640B-323. Do you have any idea where I might find information on adding the phase-lock circuit used in the commercial version of the 8640B?

Does anyone have a copy of the commercial 8640B manual who could copy the schematic(s) which show the phase-lock circuit?

Bob, W6NBI

Hi All,
Can anyone on the list near Indianapolis calibrate my HP-8640 OPT323 signal generator? I don't have a frequency standard to do it against. I do have the service manual for the unit and would be happy to drive to someones shack or shop to do it.

Thanks,
Jeff W8CQ

There's always WWV/WWVH on 2.5, 5, 10, 15 and 20 MHz. Always works
for checking and setting my frequency counter. Can you zero beat to
one of those?

Scotts suggestion is a good one to use as a standard.

The 4 pin oscillators used on computer system boards are a good standard. Digikey and Mouser have test circuits in their catalog listings. you can use a rolled collet IC socket with the un-needed pins removed and a zif socket to make a quick change frequency standard generator.

Old loran C units usually have a very accurate 10 mHz oscillator, and it can be easily used by taking a hacksaw blade and cutting the section of the circuit board loose, mounting some rubber feet, supplying input voltage and output connector.

I also have a 8640b Opt 323. It is a good unit, but doesn't have the high stability option, and can drift until warmed up. Ambient temperature in the operating environment can extend the warm up time. Even after warm-up it may still have a tendency to drift.

Component aging could be a factor, and will call for continued "correction" until they fail completely. Replacing the failing component may result in no alignment needed, and would be the best approach if isolation is possible for replacement.

How big is the manual (in terms of pages), and where did you get it? I may have to undertake the same process you are looking to one of these days.....

I do have a manual...don't recall if it's for the 8640B or 8640M, but I believe the M is essentially just a repackage of the full-blown B. There's almost certainly a B manual around here, too. I contacted a friend who I thought had added phase locking to his 8640Bopt323, but turns out he had found non-braindead 8640B's so never did it. I'm willing to do some manual photocopying, and if there are several folk interested, the copying could be a lot more efficient than if it's just one-off.

Cheers,
Tom

Panasonic make a device known as a "Bucket Brigade Device".
Basically, it is a analog shift register. They make several
different configurations from 64 stages to 3328 stages, with
multiple taps. The have a Data Book that details the use
of the devices for $3.50.

Last time I looked, these devices were sold by DigiKey:

http://www.digikey.com

You can find the devices by doing a search on "Bucket Brigade"
and you can find the Data Book by doing a search on "9102B".

I built a high density PC that used five small internal fans to move air through the cabinet. To minimize fan noise, I chose to have the fans run only as fast as necessary to maintain a fixed air outlet temperature.

To do this, I used an LM317 voltage regulator with a fixed resistor and a 220 ohm thermistor - mounted at the outlet - in the programming voltage divider. The fans do not turn on and off; they run constantly, but normally slowly.

Certainly would be the best plan if you were going for a nice quiet
arrangement for a power supply, etc.. This is for a 500 watt mobile
amplifier mounted behind the seat in a pickup truck. Heatsink
temperature picks up almost instantaneously, so I am going for some
brute force cooling with 4 fans....I would prefer they kick on full tilt
when the
temp. hits the threshold....because it means its about to get a whole
lot hotter real quick.

Scott.

A four inch 12VDC fan mounted to the heat sink blowing air into the fins
of a 4 pill amp will keep it cool and happy. Just wire it to the amps
power switch. Since it's behind the seat, a good quality fan won't be
heard. I have done this for hams and others with good results. I just
wedge the screws into the fins. You can pick up the amp with the fan.
Use finger guards if amp placement can cause fingers to enter the fan.

Happy DXing.

Perhaps you could use a thermistor to change the bias of a transistor,
putting the load (fan) in series with the collector. Have a second
variable resistor in the gate circuit to set the thresh-hold.

Just a quick thought.

Some of the better references are the data sheets for the chips themselves. Visit http://www.analog.com, grab a copy of (say) the AD7008 datasheet, grab some app notes, print them out and have a look.

Crystals within 1kHz of 457 should be readily available. Carrier
insertion crystals for SSB receivers with 455 kHz IF would be close
enough to be 'pulled' to 457 and should be available new or used from
many sources - even scrap ham receivers. I have two, in use I'm afraid,
at 465.35 kHz.

The ARRL handbook has a good section about DDS, even I can
understand it. Have a look at www.analog.com for data sheets.

Hi I'm working on a 2 watts C class for my frs radio, I'm waiting
for sample of transistor. I will give news in some days about that.
At this moment, note that making board is touchy in this freq range
462 to 467 Mhz.
I have computed value of some inductors and they are only piece of wire

astalavista....

First described in Radio/Television News in 1949 an echo chamber effect was created by placing a long spring between two phono cartridges - drive one and pick up audio off the other.

People that had high end car radios back in the early 60's remember this method of reverberation. Only problem was when you drove over a pothole/railroad tracks, it'd make a sound like "sproiinnnnggggg!"

Geez, I just hope you're making this for audio effects and not the ham bands...right? Might sound good on the romper room CB channel however. ;^)

Radio Shack used to sell a pc-board kit which used a charged-coupled device (CCD) "bucket-brigade" device to do reverb/echo. It was analog in and analog out and stored the actual analog value in the serial memory. Today, of course, we would digitize the value and throw it into a RAM.

The circuit of today would consist of :
1) A-to-D converter (quality and bit depth/word width) dependent on your desired level of quality
2) RAM with enough space to hold the desired longest delay X the sampling rate chosen
3) D-to-A converter to regenerate the original signal for output. Complimentary in design and specs to the A-to-D converter at the front end.
4) Some kind of controller which would decide where the incoming samples should be stored, and where to take samples back out (and combine them if necessary) on their way to the output D-to-A converter.

The ARRL Handbook has some information. Basically, for RF circuits with a relatively small number of turns, spacing the turns evenly over the circumference of the toroid will produce the highest Q. While in theory, any lead passing through the center hole of a toroid is considered a full turn, in practice the inductance can be modified a small amount by squeezing the turns closer together or spreading them apart. The effect is small, however, and as noted earlier you also affect circuit Q.

When winding a large number of turns, the use of a bobbin to hold the wire as it is passed through the toroid is very helpful.

When using heavy gauge wire, remember than most toroid materials are quite brittle and that they can crack easily. In both powdered iron and ferrite toroids, it is often possible to glue them back together with cyanoacrylate glue (super glue) if it is used very sparingly. You will likely lose some inductance and decrease the Q slightly but often the effects are negligible.

To hold windings in place and hold the finished toroid down to a circuit board, you may use Duco cement, high melting point hot-melt glue, cyanoacrylate glue, or polystyrene coil dope.

Amidon used to have some excellent tutorials on calculating inductance, which materials to use for certain frequencies, winding capacity, etc. One thing to worry about is to be consistent with your units when doing A(sub)L calculations. The ARRL got this wrong on an Extra-class Q&A guide a few years ago.

I'm using an AD9851 clocked at 192 MHz (32 x 6) to generate 133.3 to 135.3 MHz (144 - 146MHz - 10.7MHz) at 1 Hz resolution. The data sheet says to keep
the generated output frequency below 40% of the clock frequency but at my required frequencies the closest spurs are at about 62 MHz and 195 MHz and are within 10 dB of the wanted sig level. Hopefully, a 4 or 5 section L/C filter
will reduce these spurs.

All you need is the DDS chip and a PIC controller.

Do a google search for AD9851 and AD9852 should get you some information.

Also when hand winding toroids, unless otherwise instructed, wind all the toroids the same direction for any given radio (i.e. clockwise etc.).

When securing turns or securing to PC board, if you have clear fingernail polish that works well too - it's also easier to find.. Make sure whatever you use contains no metal flakes or corrosive substance.

Since moving on up to a twin, we also move up to 24V batteries. On that rare ocasion when the battery ran down on the single engine plane you could crank the prop and get the thing going, then find a field where the 12V battery could be charged.

The problem with a '310 is that 24V chargers aren't found at little airports, and hand cranking is out of the question.

I was thinking to construct a DC-DC boost converter/charger, and was wondering what Amp-hour rate to build into a charger for this application.

Interesting. Have you looked at the close-in spectrum look like (at,
say, 1 kHz/division through a 1 kHz filter)?

Yes, there is a lot of close-in mush.
Maybe lock the output of the DDS to a VCO to
get a cleaner signal and use that as the LO.

Hi.
I am working in a QRP 14 MHz portable transceiver. I finished the receiver section,a superhet with 8 MHz FI ladder filter, wich is quite narrow (800 Hz).
The AGC system is quite simple, so, the rf attenuator is useful with strong signals.

You can look at it at http://personales.mundivia.es/jmperales/ea6np_e.htm

I will appreciate your comments.

Or run the DDS around 34 MHz (f/4) and the VCO around 136 MHz and use
a fixed f/4 divider, consisting of two flip-flops, in the VCO feedback
path to the phase comparator of the cleanup PLL.

In this way, the DDS can be clocked directly with an overtone crystal
oscillator in the 90 .. 100 MHz without needing a frequency multiplier
chain to feed the DDS clock input.

All of the proposals that I have seen involve doing something along the lines of driving a PLL from the DDS output. Now, obviously this will help for a small range of frequencies such as those needed for a local oscillator for a transmitter or receiver. Are there any ideas for a cleanup that will work over a wide range of frequencies, say DC to 50 MHz if I wanted to use one of these devices as the heart of a general purpose signal generator.

Regards

Robin

Robin,

About the only way is to run a wide bandwidth VCO and mix it down to the DC to 50 MHz range. For example run the VCO from 100 to 150 MHz and mix it with a 100 MHz fixed source. Filter the mixed output with a 50 MHz low pass filter. Lock up the 100 MHz fixed source to your reference oscillator. Drive the VCO with the output of a PLL run off of the DDS.

The only problem then is figuring out what point the phase noise from the VCO hurts you more than the spurs out of the DDS ....

Juan,

Very impressive. Looks like a good job.

It's also interesting to see the "evolution" of the design from the earlier direct conversion radios. Thanks for sharing it all with us.

That's great if you have a 110VAC outlet handy. This is to charge the
battery from a car's battery. I am thinking to use the UC3906 as in the
1995 handbook, btw.

How about this? build a wooden box with a handle on it for carrying.. put two lawn mower batterys in it (series them for 24V)you can alweys charge them on 12V .. these batteries will crank an aircraft engine once or twice without recharging I would think..anything you build in the way of a 24V charger will be heavy,need 110V power source etc..good luck Harold (over 50 years in Avionics)

I seem to remember Military plane being started by putting a sleeve on
one
blade of the prop. and tying it to a jeep and then pulling it through.

On topic

a light weight 12 to 24 volt converter can be constructed using a IC
from Linear
Technology. I made one to operate some surplus equipment

BC548 = 2N2222 = NPN small signal transistor
This actually crosses to a NTE123AP

12V / 200ohms = 60mA - .06A * 12V = .72 Watts of dissipation.
SL100 = NTE108 which has a Pd of .625 watts.

My NTE book shows the 123AP as having more power then the 108.
Since a pack of 2N2222 (276-1617) are cheap, try it.

For a relay, 275-233 (low power reed) or 275-249 (DPDT mini).

You don't learn anything without letting out some smoke once
in a while. :)

(Damn CB'ers don't know anything, huh? :)

A relay is like an automatic switch. When you apply power, it is like flipping a switch, you just don't have to flip the lever. Electromagnetism does it for you. If you're not sure of how a switch works in relation to the contacts, look in your ARRL handbook or their website.

It's SPDT (single pole double throw) used as an SPST-NO (single pole
single throw, normally open). The contacts are an open circuit until
the coil is energized.

Thanks for your comments, Bob. I am interested in a better, but not more complex AGC system, because the shown at the schematics is quite inneficient with strong signals. But I am looking for a simple circuit. This circuit wants to be a portable QRP transceiver, not a japanese contest-grade rig. ;-)

It would make no difference, a set of contacts has no polarity. You could expect to see 4 connections. 2 for the relay coil and 2 for the contacts that are closed when the relay is energized. What are you cooling with the fan?

Thanks. So I could use a SPST relay for then? How many connections would SPST relay have on it, 4? If I understand this correctly, the N/C side would be the negative connection and the N/O side would be the positve.

Thanks..
Scott McClements.

4157. Power Supply grounding question

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-12 03:13:21 UTC
From: lagagnon@fakesprint.ca
Message-ID: <3a3597af.424693@news.sprint.ca>
Source record: 56184

I am constructing a 13.8vdc, 20A power supply...a series pass design based around an LM317K regulator, an MJ2955 driver and four 2N3055 pass power transistors.

Most of the circuits for this sort of power supply seem to show that the case is grounded to mains, along with the transformer but that the DC circuit 13.8vdc NEGATIVE line is NOTgrounded to earth. Is this correct or should it be grounded to the case also??

Any help would be appreciated. Thanks....Larry Gagnon, VE6MK

Hi ,

I have an old Telex Tribander. A few trap covers are missing. I am thinking about using some large shrink tubing to cover the traps. I would like to know if this will change the properties of the traps. The old covers never actually touched the coils of the traps whereas the shring tubing will.

Any suggeston will be appreciated.

Thanks,
Bill

Yes, this is for safety reasons in case a mains wire becomes detached and gets in contact with the case or you have a short circuit between primary and transformer core.

>but that the
>DC circuit 13.8vdc NEGATIVE line is NOTgrounded to earth.

Why should this be grounded ?

Since most likely the equipment you are feeding are connected to the antenna ground, you are just going to end up with all kinds of ground loop problems, since your equipment are both grounded to mains and antenna ground, which are usually not at the same potential and a quite large ground loop current can flow.

Yup - that's the power dissipation in the relay coil when it's turned on. The power dissipation in the transistor is a different matter.

> SL100 = NTE108 which has a Pd of .625 watts.

Yup - and that's more than adequate. Here's why:

In this application, the SL100 is usually either saturated or cut off. Under either of those situations, the dissipation is very small - far less than its power rating.

The worst-case power dissipation would be if somehow the SL100 was biased on in such a way that its emitter-collector resistance matches the load resistance - 200 ohms. Then we have a 12 volt source and two 200 ohm loads in series. Result is 30 mA of current and 12 volts - .36 watt. Half of that winds up in the relay coil and the other half in the SL100. So the SL100 could theoretically have to dissipate .18 watt - 180 milliwatts - worst case.

> My NTE book shows the 123AP as having more power then the 108.
> Since a pack of 2N2222 (276-1617) are cheap, try it.

It will probably work. But the power dissipation isn't really an issue, as shown above. Can the 123AP handle 60 mA of collector current continuously?
>
> For a relay, 275-233 (low power reed) or 275-249 (DPDT mini).

Yup. Almost any 200 ohm 12 volt relay will work.

I can't specifically speak for the Telex, but some beams use
the metal tube covering the trap as a capacitor. I recall
one case where a guy taped up the coil to weatherproof it
inside the tube and it drastically upset the resonance since
it changed the 'dielectric' of the cap. But if the Telex
has some other type of capacitor, I wouldn't expect it to
present a problem.

60 mills. That means it's working right at rating in the circuit (12
volt supply, 200 ohm relay coil) If the relay coil has less than 200
ohms resistance/the supply voltage exceeds 12 volts, the 123AP's Ic
rating will be exceeded. See below.
>
> > > (me)

> BTW, in a series circuit, all power flows through all parts.

It's usually expressed "All CURRENT flows through all parts". In the
circuit under discussion, the power dissipated in the transistor cannot
exceed that dissipated in the relay coil. When saturated, (turned on),
almost no power is dissipated in the transistor. But lots of current
can flow, and the rating exceeded.

> It's better to overdesign then underdesign.

Of course. You should see the stuff I design and build.

Using a transistor rated at Ic of 60 mA (as you recommended) is not a good idea - it's right at the edge. No margin for component tolerances or supply voltage. F'r instance, if the supply voltage climbs to 14 volts, the current in the transistor goes to 70 mA. That's underdesign.

Sorry- bad idea and this will not work (probably). I have not seen many
antenna traps in tribanders where the aluminum trap cover was not
an electrical part of the circuit, i.e. the trap cover is one plate of a
capacitor and the element tubing inside is the other plate.
Further, you will probably notice a few holes in the trap covers.
These are weep holes that allow condensate (water) to drip out of
the traps. It is important that these holes be there, that they not be
blocked, and that they point down, so water can escape.

Thanks for the input David.

My trap covers are a non-conductive material. Kind of a real stiff plastic material. Just a tube with endcaps that cover the traps. Unfortunately , the only other answer I have come up with is Schedule 40 PVC but it would be considerably heavier than the original thin walled trap cover that is very light. Sink trap pipe is almost perfect but there aren't any endcaps available for this material.

You will need a variable dc power supply and a milliammeter. Connect the positive side of the capacitor to the positive terminal of the power supply through the milliammeter. Connect the negative side of the capacitor to the power supply negative terminal. Starting at zero voltage, SLOWLY increase the voltage until the current is about 10 mA, until the full rated voltage of the capacitor is reached. It may be necessary to let the plates reform incrementally to limit the leakage current to 10 mA.

4187. Frequency of automobile remote locking signal

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-13 04:00:08 UTC
From: NOSPAM@att.net
Message-ID: <3a36eb0b.123277948@netnews.worldnet.att.net>
Source record: 56063

Two questions:

1. What frequency is used in the US for the signal which remotely locks or unlocks an automobile?

I want to increase the range of my car remote system so that I can find my car in a parking lot. In order to do so, I was thinking of installing a preamplifier before the rcvr in the car, perhaps by modifying the wideband MMIC preamplifier referenced on p. 17.71 of the 2000 Handbook (also in QST, Nov. 1997).

2. Are there any problems with this plan?

--K5LL

Replace NOSPAM by geokim when responding by email.

Doug:

You should apply DC through a variable supply that can start out low, close to 0 volts, and slowly over a period of several hours, bring the voltage up to the rated value. For safety, you should put a fairly high value resistor (10 to 15 K ohms) in series with the cap so that if it shorts at any voltage, the resistor will limit current to a safe value.

I have recently done this with some old caps. I went up in 10 volt steps and let the cap sit at that voltage for 5 to 10 minutes before moving up again. You could go slower if you want, but I wouldn't recommend going faster. Go slower the closer you get to the rated voltage. During this process be on the alert for any strange sounds, swelling of the cap, smoke, etc... If you want to excercise the caps a little more, you could periodically turn the supply back to zero and let the voltage coast back down slowly, let it set for a while, then slowly start working back up again.

You should consider doing this only with caps that are old but unused (NOS) and are worth the effort. Caps salvaged from old equipment probably have limited life left in them at best and are probably not worth the trouble.

The Telex traps on the old antennas do not have a metal cover. Over the years, a previous owner painted the traps on my Telex TB-5EM with glyptal varnish. It seemed to work. I have painted over this with acrylic paint with no ill effects.

If I had to do it today, I would use one of the plastisols like the plastic tool dip sold in many hardware stores. While this is heavily plasticized polyvinyl chloride whose RF dielectric characteristics are not as good as some other materials, the added losses will be minimal and a small price to pay for the flexibility obtained. While supposedly quite rigid, these traps do flex a small amount - enough to crack some coatings. Being a thinner coating, the RF losses will be less than the PVC pipe.

> years?

If the electrolytic is a wet, or liquid filled electrolytic from before 1940, you may have to add distilled water. Most electrolytics made after WWII are the "dry" type which are actually made with a paste electrolyte. The paste contains materials such as propylene glycol, sorbitol, etc. that absorb moisture from the air to keep the electrolyte moist. So if the unit has been stored in an extremely dry place, let it set a few days in a typical home environment to re-moisten. [Most electronic components store best when kept extremely dry. Electrolytic capacitors are the exception.]

The aluminum oxide film that forms on the capacitor anode is the dielectric. The anode is the aluminum foil upon which this film forms. The cathode is the electrolyte. The other foil serves merely to provide electrical contact to the electrolyte. With age, this oxide film hydrolyzes and dissolves, lowering the voltage rating of the capacitor.

To reform, several approaches may be used. The traditional method is to use a variable power supply, or a variable transformer feeding a conventional supply, to produce a voltage across the capacitor. The voltage is started quite low and is increased slowly while watching the current drawn by the capacitor. If the current rapidly increases, back off on the voltage and let the capacitor remain at the lower voltage for a while before increasing again. A forming current of 100 microamps to 1 milliamp is a typical maximum allowable current.

Another approach is to hook the capacitor in series with a current limiting resistor and connect the combination to a power supply of the desired voltage. Size the resistor for the initial desired charging current.(the starting current). The capacitor voltage will initially follow a typical RC time constant charging curve until the anodic film starts forming. At this point the voltage will rise almost linearly until the desired voltage rating is met.

To save some time over the second approach, I use a constant current source. This is a little faster but it is hardly necessary.

Hello--

IIRC, these use-- or used-- frequencies in the 310 MHz range, but check for companies that make SAW devices (surface acoustic wave filters and resonators) used for transmitter frequency control and receiver bandwidth limitation. RF Monolithics is one such company.

for most RF filter types, it isn't too much different, so perhaps even
22uH is sufficient, or use a 1/4w reistor with so many turns you can
wind on it using the thinnest wire you can find..

I think MCL makes these - http://www.minicircuits.com

A low-voltage relay might be worth trying, also, and would be cheaper,
if your frequencies are suitable.

Bill: That 5/4 UF?
Maybe it stands for 0.8 micro farads?
I have a bladed fan larger but much as you describe which was given to me by someone who said "It runs OK after you have given it a spin by hand!". He hadn't lost any fingers at that point! It has three wires one of which is a common. Have had success with putting a 0.5 or 1 mfd.. capacitor in series with the higher resistance winding. (Which I presumed was the starter or maybe a sort of 'field' winding) Supposed to be an AC capacitor but had success with paper DC capacitor nominally rated for 48 volts (telephone equipment type) but which I know were tested to 2000 volts static DC. Has been running for many years (at least 20) and capacitor has failed only once some 7 years ago. Does not run hot at all.
Can't remember the ohms of the two windings but I seem to recall one was about two and half to three times t'other! Any way find the common and go from there. It'll probably run either way with one winding on 'full voltage' and the other through a capacitor to give a phase shift?
Any help?

Torbay, Newfoundland, Canada. A few miles from where in 1901 Marconi received the first trans. Atlantic wireless message; an event to be celebrated next year, 2001.

4207. Question and help request on HP spectrum analyzer

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-15 01:11:50 UTC
From: satyrs <satyrs@flash.net>
Message-ID: <3A396FD2.3FE937E6@flash.net>
Source record: 56083
Cross-posted to: rec.radio.amateur.homebrew,alt.ham-radio.hf,rec.ham-radio

I recently purchased an HP 8557A spectrum analyzer, and have been using it as a band scope for the ham station. I connected the input of the analyzer to the IF output of my FT1000, tuned the analyzer to the 74.62MHz IF frequency, and it really works well.

Problem is, the analyzer drifts like crazy, and I find that I have to tweak the frequency control on the analyzer all the time to keep the display centered where it should be. This makes it a bit difficult to read the display to determine the frequency of those quiet spots on the band.

First question, has anyone have experience with the 8557A? Is a lot of drift in the frequency tuning normal, or do I have a defective unit? It gets more stable after an hour or so of warmup, but the drift after that is still significant, maybe 10-15KHz/minute or more. It doesn't take long before the center frequency is clear off the scope at 5KHz/division.

Second question, if the drift is fairly normal, has anyone looked into some method of stabilizing the local oscillator in the analyzer? According to the maual, the first LO in the analyzer tunes from 521.4 to 871.4 MHz, which translates to the 0-350MHZ range of the unit. Might there be a way to build an outboard synthesized oscillator to replace the analyzer's LO?

My other option that I have been thinking about is to purchase a RF Generator that is synthesized and put a pushbutton switch that switches from the RF generator to the input from the radio. I could then quickly see the deviation and tune the analyzer back to the correct center frequency. This all sounds kuldgey though.

If anyone has any ideas, I would appreciate them. Please email me at rbrocaw@flash.net. Many thanks for reading this post.

On the 4CX250 and family of tubes, under what conditions would
I most likely see the negative current that Eimac warns of?

Is the screen actually emitting?

What would be the best way to keep my amp away from this operating
condition, such as loading heavier, or lighter, etc.

Capacitor technology has progressed so far in just the past five years,
that I can see no good reason to fool with an old cap. Kind of like
flipping the handle on a gernade, and counting to 100 before throwing.

New caps are better, less ESR, and smaller. Unless the old one
has a nostalgic value, I would dumpsterize it.

The club that I am a member of is trying to find a device to
accomplish the following task..

We have an aircraft ELT receiver which provides a contact closure upon
reception of an ELT. When this unit activates (it is located high
atop a nearby mountaintop) we would like it to key up a radio and
transmit a predefined stored voice message, or even just a tone for
that matter.

My question is... short of a full blown repeater controller does
anyone manufacture such a device. Or, what repeater controllers can
handle this task?

Any suggestions?

Thanks! Shawn

Normal class AB1 linear operation. When the amplifier is tuned and loaded correctly for peak speech levels, the screen current will be about +2mA per tube; but at lower levels of drive it can easily go to -5mA.

>Is the screen actually emitting?
>
Yes. For an explanation, go to:
www.ifwtech.com/g3sek/boards/tetrode/tetrode.htm and then download either qex.zip or qex.pdf

The most complete description of what's happening is in the chapter by GW4FRX in 'The VHF/UHF DX Book' which is available from RSGB or ARRL.

>What would be the best way to keep my amp away from this operating
>condition, such as loading heavier, or lighter, etc.
>
You should not try to keep the amp away from negative screen current - it is normal for the 4CX250/350 family, so your screen supply must be able to handle negative screen current without losing regulation.

How can you go from the SSB phase noise of a generator to a
frequency probability function? I'm thinking if I turned a sine wave
into a sq wave, say with an IDEAL comparator, how would the phase noise
affect the jitter in the pulse width (jitter being here one standard
deviation of a group of pulse width readings)? If I had the phase noise
as a probabilty function, I could get the freq offset that occurs at one
standard deviation, and use that to get the time at one standard
deviation. Then the jitter would be the difference between that and the
mean pulse width.

Electrolytics actually have only about a 10 year shelf life
then they have the potential to become un-reliable. It's best to just replace
it rather than try to zap it back to life. But then some people like to see
fire!

It will be anything from a few tens of Ohms to several thousand Ohms,
depending on the frequency, the length of the antenna wire, the length
of the feeder and the efficiency of the earth system.

Sounds like a job for NEC.

Hello:
CCW has been around for quite some time, and several
hams (W7GHM,VE2IQ,etc) put together "hardware intensive"
stations to send/decode CCW. The more recent program
PCW by DJ7HS makes it easy for someone with a PC and
a very simple interface to try the mode. It is IDENTICAL to
perfect morse with an additional set of dits (not e's) at the
beginning of the transmission to sync up your receiver.
After that the software locks onto the tone aided by a very narrow
filter (10-200 Hz BW)and produces the best machine decoded
copy I have seen to date(and I've tried many of the PC morse
decoding progs). You can listen to this with your own ears and
copy it exactly like regular morse. It is just On-Off-Keying (OOK)
so there are no linearity or overdrive issues, and it can be
used with simple homebrew equipment (as long as its stable).
My best HB rig for this is on 17 meters, so I will be on soon.
Check out the link I gave and the other CCW sites you
can search for (www.Yahoo.com or www.NorthernLight.com)

hams (W7GHM,VE2IQ,etc) put together "hardware intensive"
stations to send/decode CCW. The more recent program
PCW by DJ7HS makes it easy for someone with a PC and
a very simple interface to try the mode. It is IDENTICAL to
perfect morse with an additional set of dits (not e's) at the
beginning of the transmission to sync up your receiver.
After that the software locks onto the tone aided by a very narrow
filter (10-200 Hz BW)and produces the best machine decoded
copy I have seen to date(and I've tried many of the PC morse
decoding progs). You can listen to this with your own ears and
copy it exactly like regular morse. It is just On-Off-Keying (OOK)
so there are no linearity or overdrive issues, and it can be
used with simple homebrew equipment (as long as its stable).
My best HB rig for this is on 17 meters, so I will be on soon.
Check out the link I gave and the other CCW sites you
can search for (www.Yahoo.com or www.NorthernLight.com)

>Between which two points would you connect your impedance
>bridge to measure it ?

The antenna is 41m long (not 43), feeder is connected at 13.6m from
one end, feeder length is 10-15m (open wire) to ATU

It is operated on 80m, preferably in the 3.5-3.6MHz CW segment.
Suppose it is high impedance as for halfwave end fed radiator ?

My problem is that I must design an outdoor operated ATU and provide
some tappings on the coil for impedance window, but if the ATU shall
cover large range of impedances it makes it more complicated. I have
already used some remote ATUs, the last is an ATU for G3LDO type
halfwave sloper on 30m band, so I feel absolutely no problem in
building ATU's, have over a douzen of high voltage variable capacitors
and good coil formers, the power is only 5W for the particular purpose
and the coax is 100m RG11 (75 ohm) going from radio room through the
bunker to a suitable opening which was water pipe during WW2

see http://www.nuav.net/batterievara.html for more info about the
project

since the nearest neighbour is a km away and it is lot of space for
antennas, it might be a better idea to look for some 136kHz vintage
equipment to operate, but transmitters are rare...

Hi all,
I recently bought a neat old HB rig because I thought it was beautiful.
It was originally published in QST, June, '58, written by George Bigler,
W6TEU, and was also in later SSB Handbooks, which I have referenced on the
website where you can view it:
http://www.thecompendium.net/radio

This unit was built by K8EOP, Carrol A. Wilson, of Adrian, MI, now SK,
probably sometime in
the early sixties. I think he did a terrific job, and I'm glad to be able
to show off his workmanship. If you can supply any more info on OM Wilson,
or on others who had built one of these, I'd be glad to hear from you.
I'm also looking for originals of the magazines that it appeared in,
both QST's & SB Handbooks. There were also apparently several "Hints &
Kinks" type notes with modifications, etc, some of which must have been
incorporated in this unit.
73,

Jan, the name 'windom' means very little to me. But from your description you have a horizontal wire, all in one uncut length, 41 metres long, 1/2-wave resonant on 3.6 MHz, fed via a single-wire (not twin open wire) feedline connected at 13.6 metres from one end.

At the resonant frequency the feedpoint resistance will be 1200 ohms.

Which is what you wanted to know. But if you are interested in an impedance match at that point there is no single-wire feedline which has such a high impedance.

Zo of a single wire feedline depends on its length, wire diameter, height and frequency. At HF it is of the order of 500 to 650 ohms. Say 600 ohms. If you want to know whereabouts on the antenna wire the feedpoint is 600 ohms then you have to tap nearer to the centre of the antenna.

For 600 ohms, tap the feedline into the 1/2-wave resonant antenna wire at a distance from the centre of about 12 percent of overall antenna length. The exact tapping point depends on antenna wire diameter and height. Experiment with a crocodile clip.

For your antenna, connect the feeder at 41 * 0.12 = 4.9 metres FROM THE CENTRE.

At the input of the feedline you will see something in the order of 600 ohms which is not difficult to transform to 50 ohms if that is what you have in mind.

What happens at other frequencies and on other bands depends on what you ate for breakfast last Thursday. Why don't you just put up a random length dipole with an open wire twin feeder and be done with it ?

Minicircuits addresses the 75 ohm vs 50 ohm issue in their design notes.

Just build up the circuit per minicircuits' recommended schematic. Choose the coupling caps by figuring out what the lowest freq you want to pass and choose the value based in its reactance. Makes a great wideband preamp, or add tuned stages to the input and output if you want some selectivity. All of the MAR series (excpet for the -6 IIRC) are unconditionally stable but it's best to build the circuit on a nice ground plane. You'll just degrade the noise figure if you mismatch the port impedances, never had 'em oscillate.

4240. power supply regulator dropout??

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-16 18:22:22 UTC
From: lagagnon@fakesprint.ca
Message-ID: <3a3bb2cc.2249373@news.sprint.ca>
Source record: 56017

I have just completed construction of a 13.8vdc 20 amp power supply to power some amateur radio equipment. It is a typical series pass design, built around a large 15vac transformer, an LM317K regulator, an MJ2955 driver and four 2N3055 power pass transistors. All seems fine except for one thing! When there is no load the voltage into the regulator (ie out of the diode bridge and filter capacitors) is about 18.7vdc and I can easily adjust the LM317K to get me 13.8v. However, under a continuous 10 amp load the voltage to the input pin of the regulator drops to about 13.7vdc and the output supply voltage is only about 12 volts, rather than the required 13.8v.

I suspect that the dropout voltage of the LM317K has been reached (it is about 2.5 volts according to the datasheet). The voltages at the regulator pins suggest that. Would there be any other problems that could contribute to this lack of regulation?

I did not plan for such a large votage drop out of the transformer under load and should perhaps have purchased a higher secondary voltage (but this 25 amp transformer was a steal surplus and I thought it would be sufficient).

I believe the only way around this (short of a new transformer with a higher secdondary) is to replace the LM317K regulator with something like the LT1086CP, which has a dropout voltage of only 1.5 volts. However, I am concerned that at 20 amps continuous load even that 1.5 volt differential might be reached. Does anyone out there have any other suggestions??? thanks...

Larry, you should be getting about 25 volts dc under no load. Check the transformer or diode bridge to make sure they are correct.

You seem to have too little voltage out of the transformer. Most supplies use a transformer of around 18 volts . This allows for the voltage drop of the rectifires and pass transistors.

One thing you might try is to install a seperate transformer to supply the regulating circuits and just use the one you have to go to the pass transistors. This or other windings on the transformer have been used in the comercial supplies. This lets you have enough voltage to work the regulators and only have to have about a volt or two more to drop by the pass transistors.

Unfortunately, you don't have enough transformer. The fact that the XFMR was only rated at 15 vac clues you that it will not be enough to regulate at 13.8. You could put a doubler ckt in, but you would lose current capability. All you can expect out of any full wave or bridge ckt when loaded is 90% of transformer secondary rating (15 X .9 =13.5 vdc)

4246. ICS Electronics Multi-Mode Terminal Unit - Can You Help Me?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-16 20:02:34 UTC
From: Pete <pete@keirle.fsnet.co.uk>
Message-ID: <91ghlomao6@news6.svr.pol.co.uk>
Source record: 56023

Hello readers,

Can you help me with any information on the ICS Electronics Ltd. All-Mode Terminal Unit?
I purchased this at a rally in Deven and all I can tell you is that it decodes the following modes...

CMD
ARQ
FEC
RTTY
CW
ASCII

The front panel has a LED segment tuning display, Wide/Narrow + Nor/Rev switching and a
cluster of status LED's on the right-hand side.
The rear panel has two 5-pin DIN sockets marked 'Terminal' and 'Xcvr', three presets for audio
In/Out and PTT and a DC supply socket.

The unit is made by ICL, Arundel, W.Susssex.

My unit was bought "as seen" and is not working. I would appreciate any info. at all. Perhaps
you have some idea of the pin designations for the two DIN sockets..?

Well, thanks for reading this and thanks in anticipation for any possible info.

73's and best regards...
Pete.

Use another transformer on the input to boost the input voltage to the transformer to get enough output so it'll stay in regulations. The opposite of the old bucking scheme to drop voltage for antique radios when things were designed for 110-115 rather than more current 120-125 or more.

Won't need much of a transformer as the input current is low comparatively speaking.

You might also look at the voltage across the filter caps with a scope to determine what the ripple at that point is under load. The lowest point of the waveform needs to be at least the output voltage (13.8) plus the regulator drop (2.5) or 16.3 volts. If the transformer really puts out 15 volts RMS then the peak of that waveform should be 15 x 1.414 or about 21 volts. Increasing the capacitance will cause the full load voltage to climb closer to the peak value. You *might* be able to prevent the drop out if you can add enough capacitance to the input.

The voltage you are reading now under no load looks a bit low (18.7 volts). Transformers are usually rated for 15 volts under the full 20 amp load and should put out a bit more under no load. Add to that the fact that the capacitors will charge to near the peak value and you should be looking at over 21V under no load across the capacitors.

Don't forget to subtract for the rectifier drop, about 1.4 volts for a bridge circuit. That should put your peak voltage at 19.6 under full load and probably a volt or two higher under no load.

I would think you could simply wrap'em up (individually) in good
ol' kitchen aluminium wrap.

But, is there *anything* in a TR7 that is particularly static sensitive?

Aluminum foil will work fine. Just insure it isn't charged with static before
you touch it to the board.

Hi there,

I could very easily be wrong, but...

When I looked a CCW a few years ago I found the siginificant *DIFFERENT*
feature is the stations in communication are locked onto a master clock
somewhere. It might be that one of the stations can sync with the other's
clock. The benefit to the decoding software/hardware is knowing when to
expect a signal and when to expect silence.

I remember that the speed in wpm was fairly slow, but the machine
reliability was extremely high.

Bill KU8H

So... how badly did I miss the point?

I think that's basically it. I believe most ham CCW synchronized
separate clocks by beginning each transmission with a string of dits.

From: Robert Richardson <rrichard@zianet.com>
Message-ID: <3a3d7253.0@oracle.zianet.com>
Source record: 55962

The standard rule-of-thumb for low-voltage power supplies is at least 1000 mfd of filter capacitance per amp of output. They work better with 10,000 mfd per amp. The output voltage from that 15 volt transformer should be at least 21.21vdc, with no load. Either the capacitance is too low or your bridge rectifier is bad. The output voltage with a capicatance input filter should be 1.414 times RMS measured voltage if all parts are good. 18.7 volts is too low! Good luck finding your problem.

Precisely-
PCW.exe cranks out a 30 second string of 12wpm dits by
preceding your text with "$". You don't need any clocks.
note: If you try the program, it worked best for me in
DOS mode(not dos window) and with a SB16
clone (not my Ensoniq card). Someday someone will write
a win9x wersion that will tolerate various soundcards, and
this would be a boon to the mode.

4258. Re: phase noise question

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-17 03:26:05 UTC
From: Richard Karlquist <rick@area.com>
Message-ID: <hnW_5.38689$M5.1448205@news1.frmt1.sfba.home.com>
Source record: 56033

See M. C. Fischer's papers in the proceedings of the Frequency Control Symposium, 1977 and 1978. They
have a fairly straightforward method to convert a phase noise plot into a plot of Allen deviation, from which
jitter can be computed. The IEEE web site has these papers in electronic form now. There is also an old
NBS monograph that has a very good chapter on conversions between various ways of describing
phase noise. You might see if NIST still has it in print.

Building an ideal comparitor to convert a sine wave into a square wave is a non trivial problem. An excellent
treatise on this was presented at the Precision Time and Time Interval Symposium by John Dick of JPL
around 1990, give or take a year. What he basically says to do is run the signal through a cascade of limiters of
increasing bandwidth until you get a "square"enough wave. The mistake most people make is to get the
fastest comparitor they can find, and just feed the sine wave into its input.

4259. OT: Power Generators

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-17 06:06:45 UTC
From: KG4FGN <kg4fgn@mindspring.com>
Message-ID: <91hl04egh1@nntp9.atl.mindspring.net>
Source record: 56034

This is slightly OT, but I've learned a lot by reading messages here so maybe someone will know the answer to my question.

I'm sitting here without commercial power right now. I live in the country, and every time the power goes out it stays out for about 20 hours on average. (Thank goodness for laptops with good batteries!)

The previous owner left me a gas powered generator that lets me run a few lights, the fridge, and a space heater or two to keep warm with.

My first question, does the rate of power consumption have any affect on the rate at which it burns gas? i.e. if I pull more current does it go through the gas quicker?

Next, the gas tank on this thing is rather small, it only seems to hold enough gas for about 3 hours. This means I have to get up at least once if not twice during the night to step out back (brrr) and refuel and restart the thing. The instructions say I only have to leave it off for two minutes after shutting down to refuel, so it's not getting a big rest. Is there any good reason why I can't fit this thing with a bigger gas tank? Even one just twice as large would be nice.

Thanks,

Robert / KG4FGN

Yes you can parallel two 50 Ohm coax cables to get an effective 25 Ohm cable. For one work project we needed a ten Ohm cable so we used five 50 Ohm cables in parallel. It worked great.

4262. Exposure of double-sided PCBs

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-17 08:10:35 UTC
From: Murray Lang <muzzle@iexpress.net.au>
Message-ID: <Wq__5.1$y_5.189@wa.nnrp.telstra.net>
Source record: 56037

Here is a trick I just discovered. It's probably not original but here goes anyway.

The problem was to expose two sides of a PCB with two transparencies and keep all the pads aligned.

My solution is to stick the two transparencies together using two lengths of double-sided adhesive tape (the kind that's about the thickness of a PCB). The tape sits along two adjacent edges of the PCB outline, forming a corner that the blank can be nestled into. Only one length of double-sided tape (preferably the longer piece) has the covering removed to hold the two transparencies together. The other length is left covered so that the two transparencies can be opened up like a book to accept the PCB blank.

Here are the steps I took:
1) Draw an outline of the PCB blank on a sheet of paper.

2) Secure one of the transparencies, along with the paper, to a working surface so that the artwork is appropriately orientated with the outline of the PCB blank.

3) Attach a length of double-sided adhesive tape along one edge of the outline.

4) Place the PCB blank gently against this tape and attach the other length of tape along an adjacent edge, gently sliding the tape against the PCB blank as it's lowered and attached.

5) Put the PCB blank aside.

6) With both lengths of tape still covered, manoeuvre the second transparency so that everything is aligned.

7) With a finger and thumb, firmly press down near the edge of this transparency opposite the longest length of tape. Obviously make sure nothing moved otherwise go back to the previous step.

8) Lift the edge of the transparency adjacent to the long piece of tape and, keeping it up with your nose/chin/tongue/etc, remove the tape's covering.

9) Gently lower the transparency down onto the tape then press down so that it sticks properly.

That's it!

For exposure simply open the transparencies up and nestle the sensitized blank into the corner. If you can only expose one side at a time (my own situation), just be a little careful when you flip the board/transparency

package over. It seems quite secure and I've had no problems so far.

I hope this is helpful to someone.

Regards

Murray - VK6HL

4263. Re: OT: Power Generators

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-17 08:33:49 UTC
From: Ham <no@sp.am>
Message-ID: <3A3C7A6D.54FB86D9@sp.am>
Source record: 56038

More current = more load = faster gas consumption. It takes more energy input (gasoline) to get more energy output (electricity). Probably not a 1:1 effect though.

Sure, put on a larger gas tank. Better yet, convert it to propane so you don't have to worry about gas getting stale and the problems of gas vapors and storage. A 20 gallon tank of propane is a lot easier to manage and can easily be moved by one person with a hand cart. We use them in the Sierra 10 miles from electric lines and on a road too steep and narrow for propane delivery trucks. We don't have electricity and use propane for cooking and refrigeration and hot water but we have neighbors who use propane for electric generators. Then you won't have to get up during the night! Hey, you could even get a propane space heater (vented) and wouldn't have the losses involved in producing electricity and then from there to heat with an electric heater.

Save some energy and put your refrigerator contents outside and don't power the refrigerator. If you don't open the door to the refrigerator the frozen stuff should last OK for 20 hours. We've had outages for as long as 3 to 5 days and I've gone and bought dry ice after 24 hours and the freezer on the refrigerator has still had solidly frozen food in it at that time.

>Unfortunately, you don't have enough transformer. The fact that the XFMR was
>only rated at 15 vac clues you that it will not be enough to regulate at
>13.8. You could put a doubler ckt in, but you would lose current capability.

Or use a doubler circuit only for the regulator (and possibly driver)
supply and run the main series pass transistors from the current main
supply. The output voltage will be the power transistor Vbe drop (or
power transistor Vbe and driver transistor Vce) below the capacitor
voltage. For big power transistors at high currents, the Vbe is about
1 .. 2 V.

The regulator driver doubler can be constructed by connecting the
regulator bridge via big capacitors to the transformer winding and
connecting the rectifier DC side in series with the main DC supply.
This kind of circuit require that the main supply is loaded all the
time, so a bleeder resistor should be in the main circuit to draw some
current.

There are other ways of constructing low drop-out regulators. Using
the existing series pass NPN transistors in the negative line and
connect the positive +13.8 V output directly to the capacitor "+"
terminal. The drop-out voltage is only the Vce for the series
transistor, which is usually less than the Vbe drop at large currents.
Look for any low drop-out negative regulator circuit.

18 VAC would probably have been a better choice for the transformer.
As it is, you would probably need an unusually large filter capacitance.
The suggestion to run a series-aiding transformer to boost the voltage
on the primary might be worth considering- perhaps a 6.3V, 4 amp
filament transformer. I would not feel comfortable boosting the
voltage much more than this, long term, however. In your case, every
little 5 percent might help. How much capacitance do you have in
your circuit, anyway? 73, David K3KY

Even if they are not compatible or are marginal, there are
simple circuits with transistors or relays that will handle the
switching. As long as you are not in a big rush to hook it
together and try it, there is surely a way. You definitely
should make sure the 830 can handle it before ever hooking
them together. The relay contacts in the 830 may be too
wimpy to stand up to the job long term. I seem to remember
the switching voltage/current in the Yaesu and also the Heath
SB-200 and 220 types as being too much (long term) for
small relay contacts to handle. There were both interface
circuits or some simple mods you could do in the amps
themselves that took care of this.

I have also seen the 10 year figure a lot, and I'm sure it is indeed best to use fairly new units. I can tell you, however, that I have reformed quite a number of considerably older electrolytics over the years and successfully used them. The way I do it is to slowly ease the supply voltage up from zero, through a 1-2K, 2 W carbon resistor. I take it slow and monitor current and generally keep the current pretty low all the way. Once I have got it up to near full rated voltage, I continue to watch for a good while, and I look for the leakage current to drop way back- we're talking tens or certainly no more than hundreds of microamps here. I also take into consideration whether this tiny leakage current ultimately stabilizes or not. If it is fairly erratic, I usually derate the test capacitor considerably, if I use it at all. (I usually have quite a number of units, except in the case of big computer grade caps, and I always test for and pick the best) I am talking about only *new* old stock units here- with older caps I have no interest in used units, with the possible exception of certain computer grade caps. I have been surprised just how many seem to reform well, with very small, stable leakage currents. While I have not used huge numbers of these, caps that blow have been quite rare, in my experience, and have usually been the older style in the twist lock cans, especially some European ones I had. I have yet to

see a really major or messy explosion. The few I have had go bad vented rather uneventfully with no real mess or noise. 73, David K3KY

You can measure the requirements for the FL-2000 very simply. Use the multimeter to measure the open-circuit voltage at the control socket. Then change to a current range and measure the current (the amplifier will switch over, of course). That will give you some basis for judging the capabilities of the relay.

There is a good article on the SB-220 by AG6K at
http://www.vcnet.com/measures/cisb220.html
This mentions that it can burn out transceiver relays - not so much because of the 115V/25mA switching requirements, but because there's an RF bypass capacitor on the switching line which charges up to 115V and produces a large current surge through the relay. AG6K says that a 100-200 ohm series resistor cures this problem.

It may be worth checking whether the FL2000B has any components of this type.

AG6K's site also has an excellent article on maintenance and mods for the TS-830S, which includes a modification to use transistor switching.

Hi!

I've been using my TS520S with my Linear Amp UK 811H and my
FL2000B for some time now without any problems at all.
The relay in the TS520S handles the current without any problems at all.

I also use the same amps with my FLDX400 valve transmitter, the relays
in it are somewhat more substantial,
and noisier too!

Good luck, and keep those valves glowing :)

Well yes, but.... Beware of Normally Open (NO) vs. Normally
Closed (NC). The contacts in your image are illustrated
upside down from the usual presentation (NC up, NO bottom.
A SPST (single pole, single throw) will have 2 contacts
rather than 3 (typically NO, but *could* be either way) and
2 coil wires for a total of 4.

4271. L.O.S.A - List of Stamp Applications [001217]

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-17 15:06:10 UTC
From: cjX@hth.com
Message-ID: <3a3cd620.50858081@news.sverige.net>
Source record: 56046
Cross-posted to: comp.robotics.misc,comp.home.automation,sci.electronics.misc,rec.radio.amateur.homebrew

Hi,

Below is the latest index of L.O.S.A and it now contains 210+
BASIC Stamp projects. You can download the complete L.O.S.A
from the following places...

WWW:

http://www.hth.com/losa/

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially Guy
Gustavson's story (see #001) about how he saved his beloved cat Kesha
gave me the inspiration to start writing L.O.S.A. I hope Kesha still
is alive and having a great life. Now 5 years later there are 190+
applications described and I hope you will enjoy reading all (or
parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa/

1.2 Why are some links dud's ?

Since people changes their e-mail and web addresses some links may be
dud's. If you previously contributed with one (or more) of the

applications please take a quick look and check your e-mail address
and/or web-links. I'm only able to keep the list updated if I'm
informed about changes, thanks in advance.

1.3 List of contributions

I too live in a rural area and loose power often (One time for 15
days!).

Yes, the more power (energy) you use the more fuel it takes.

A large gas tank could be use. I still have the small one on my
generator as I shut the thing down during the night. Not opening the
refrigerator keeps things just fine over night plus your saving fuel.

I don't use electrical heating (uses too much power) and depend solely
on my wood stove at those times. Heck I use the wood stove most of the
time any way.

Hope you to open up you mains when you run the generator.

Danny, K6MHE

Agreed, but you will have less available power output with propane. Depending
on the type of conversion about 85 - 90% of rated power.

Larry...
Just a quick tip (not design details). I think I'm right about this.

I seem to recall that you can operate down to a lower unregulated
voltage by using a circuit where the output is taken from the COLLECTOR
of the pass transistor, rather than the emitter (the emitter being the
input end). For a positive supply, you use a PNP pass transistor.
Essentially, the circuit regulates down to the bottoming voltage of the
pass transistor (say 0.2V).

Unfortunately, for high currents where you have to use paralleled pass transistors, you will still need emitter 'ballast' resistors for each transistor, so you will drop some voltage across these.

73,
Ian.

>....[snip]....

Be careful: A generator with such a small tank is probably NOT rated
"for continuous use", so adapting it to run essentially continuously
MAY cause it to fail earlier than expected. (Your mileage may vary)

I recently purchased just such a small generator, and noticed, while
I was deciding what to buy, that generators of the same size but rated
"for continuous use" cost a LOT more (more than just the cost of a
larger gas tank); I like to think that that extra cost was justified
somewhere in the design/construction of such generators.

power
> output from everything! 73, Bob K6DDX
==========

Bob , I agree with you on most points you make ,except for the 'full power'
declaration.

If you consider the DC power ratio at 12.5 V against 13.8 V DC supply ,the
figure is 12.5sq/13.8sq=0.82

Since it is unlikely that at the reduced supply voltage the efficiency of
the RF power stage of the transmitter will increase (it is probably the
contrary) the RF output power will also decrease by not less than 18%.
Not that it matters a lot . A decrease of 50% of output power would result
in a reduction of only 3dB ,which is half an S-point . Please accept
that I am not trying to nit-pick , but just to get it correct.

My interest in this topic is because I am running my station on 12 V (deep
cycle) lead-acid batteries which in the near future will be charged by a
wind generator and 2 solar panels.

A power supply like you described will work well with at least +21 VDC at input of series regulators ...one way to solve the problem is to add another transformer to the one you have ,add 5 V @ 20 amps ,or change the original transformer to give the required AC voltage...good luck Harold W4PQW

I have what is probably the smartest solution to this problem.

If you set the output of the supply to about 12.5 Volts it will probably regulate just fine. Most "12 Volt" equipment is rated at 13.8 Volts because that's the high end of the regulation range of an automobile battery system. The equipment will usually meet specifications and last a lot longer if you run it at 12.5 Volts or so. A plus beyond that is that the lamps won't burn out as frequently; a 10% drop in lamp voltage usually gives about a doubling of lamp life.

I have been running all my 12 Volt stuff at 12.5 Volts for years and have had no failures related to anything that might be attributed to heat or excessive supply level, and the lamps all still light fine. And full power output from everything!

> twice as large would be nice.

You are abusing yourself, if not your generator. Get a platinum
catalyst space heater that runs on propane, the ones made by US
Catalytic
http://www.uscatalytic.com/heater_index.html are good examples, for
heat in
the event that power goes out or the furnace fails. No flue is
required with
these heaters, you just crack a window a little to get any required
venilation.
These heaters will run for days on a small portable propane tank. You
will
get to sleep at night, instead of spending it servicing your generator.

Use the generator to "cool off" the fridge and freezer once in the
morning,
and to run the lights and cool off the fridge and freezer again in the
evening
before you retire. The 3 hour run time will be fine for that purpose.
You
may be able to find an "extended run" tank for your generator depending

upon
its configuration, but make sure that any such tank is designed for use
with
your generator and is properly installed.

2400 .. 4800 bit/s :-).

A 50 MHz crystal is a third overtone crystal, with about 100 ppm (5
kHz) maximum pulling range (but not necessary with that circuit). With
a modulation index around 1, a data rate of 5 to 7 kbit/s could be
expected.

It would seem that an off-line switcher would do this job with a lot less "transformer angst", and if you have a copy of the 2001 handbook you should note that the power supply examples have some good skinny on winding your own.

There is so much software "freeware" and folks like Nat Semi, Analog Devices and TI are very forthcoming with ways to make power supplies "analog ready". Perhaps I am just cheap. My kids say that I have inherited the "cheap gene", but it skipped their generation. I can't abide the notion of burning watts with an LM317K and pass transistors.

4295. Toroid winding

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-18 18:28:12 UTC
From: n3qxc <n3qxc@hotmail.com>
Message-ID: <0Hs%5.51568$w35.8824764@news1.rdc1.nj.home.com>
Source record: 55972

Gentlemen,

I've just recently gotten back into the Ham radio hobby and I have been experimenting with toroids. I have a question about toroids... I have the book from Amidon and a supply of different toroids. Nowhere in the book does any formula explain the relevance of wire gauge. I recently build a 10 meter pre-amp from the Amateur radio handbook 1979 edition, the instructions said to wind #24 awg around the toroid and I did.... It works great. But what if I was to use # 22 awg? Would I have to wind another winding to create the desired inductance?

Also... is anybody familiar with the 10 meter pre-amp in the Amateur radio handbook? If so... Is the tuning of the capacitors always that sharp? I was doing testing on the pre-amp and hooked it to a receiver and tuned both input and output tanks. It took some magic to get rid of the oscillation. Anyhow, Just a sixteenth of a turn on the varicap is the difference of the pre-amp working or not. I ran the formulas on an excel spreadsheet to see if I could create a smoother point where the capacitor could be adjusted and found nothing better than what I have. 42 to 49 pf adjustment moves the tank from 28 to 30mhz.... any ideas on how to make this better? The amp also includes neg. feedback... so it has reduced gain and a large bandwidth... So adding feedback loop has already been done....
Just a bit more info for those who don't have the circuit in front of them... the circuit is a single mpf102 mosfet with a tuned input and output using a T 50-6 Amidon toroid. 12 turns #24 awg secondary and a single turn primary.

Any help is greatly appreciated...

4297. Tube Mic Preamp Circuit Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-18 20:24:47 UTC
From: ilikedeja@my-deja.com
Message-ID: <91lrq6$8ti$1@nnrp1.deja.com>
Source record: 55973

I would like to build a single-ended mic preamp utilizing a 12AX7 or similar tube. I need it to have a low-Z balanced input (300-600 ohms) and a balanced low-Z output. Since I am planning to use it with a dynamic mic, it doesn't need to provide phantom power. I don't need a lot of fancy features; just a good, basic circuit. Can anyone point me to a schematic on the web or email me one? Thank you.

Michael

Wire gauge has relatively little effect on the inductance. The choice really is trading off current carrying capability and winding resistance (which impacts Q), versus the ability to fit enough wire on the toroid and the handling of the wire.

In general, you want to use the largest wire that will fit. In the ARRL handbook, there is a table of turns vs wire and core sizes. It tells you how many turns will fit on a given core. In your example, if the project called for 22 turns on an FT37-43 core, you would have been unable to fit that many turns of #22 on the core, but #24 would fit with room to spare.

All of the fitlers, ceramic and crystal, that I've seen that come in narrow packages with the pins in a line, put the ground on the center pin. The idea being that it provides shielding between the input and output. I've assumed, perhaps erroneously, that the filters are summetrical so the input and output are interchangeable. More important would be loading them with the proper impedance. If I find filters on circuit boards, I make a point of tracing the circuitry connecting to them, or keeping the boards intact until I actually need a filter.

You often see more sophisticated ceramic filters. They are larger, have more pins and require a capacitor across two pins. I can't remember exactly the layout for those that I've seen, but pinout hasn't been what I've expected.

The inductance will be very nearly independent of wire diameter.
However, there's resistive loss in the wire, which gets worse as you
make the wire smaller. And if the wire is large, it gets all bunched
up on the core and the turn-to-turn capacitance is large, which lowers
the self-resonant frequency. I believe it's true that in common
powdered-iron and ferrite core toroids, the loss for a properly chosen
wire size is dominated by loss in the core, not in the wire, but if you
make the wire thin enough, it will dominate.

Have a look on http://www.btinternet.com/~g4fgq.regp/ for toroid.exe, a
little program (PC/DOS; runs in Win env. fine) that will help out in
this area. (Thanks, Reg!) I'm a little surprised that Reg didn't
include an estimate of self-resonant frequency and effective distributed
capacitance in this program, since it's in other of his inductance
calculation programs. Not complaining...just surprised.

Cheers,
Tom

Yes, that was the first place I looked. I've downloaded all their data about
my filter but nowhere (that I can find)
do they give pinouts. They only number the pins.

I think I can probably get by now just knowing that two of the pins are
connected together as ground and that the filter should be symmetrical.

Thanks anyway
Murray

4303. Re: Exposure of double-sided PCBs

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-19 00:50:12 UTC
From: tom_bruhns@agilent.com
Message-ID: <91mbc1$nl8$1@nnrp1.deja.com>
Source record: 55980

Thanks to Murray for posting his technique. In the spirit of "it's always better to have alternatives to pick from," here's the technique I've used for a long time that works well for me:

1. Make the two transparencies (I print with an inkjet printer on transparency film, image flipped so the ink will be adjacent to the board with no intervening film).
2. Cut one transparency smaller than the other, so the larger overlaps the smaller at least on two opposite edges. Leave some space, an inch (couple cm) or so of transparency film beyond the board edge on those sides.
3. Put the two together, ink sides facing each other. Align them (easy with small holes in some pads, or with alignment marks in opposite corners), and tape along one edge. This is just with simple cellophane ("Scotch") tape, very easy if the smaller one is on top.
4. Lift the top transp. and put the board blank on the bottom transp. Use a bit of tape to hold it to the bottom transp. I usually tape opposite edges, with the tape covering maybe 3mm or 1/8 inch of the board; I always cut my board blanks so I can trim to size after etching, and in any event don't have traces/pads right at the edge.
5. Lower the top transp. If it's a large board, you can tape the opposite edge of the top transp. to the bottom transp., but I find that's usually unnecessary.
6. Put in print frame, and expose thru the top transp.; flip the sandwich and expose the bottom. Note that the tape holding the board to the bottom transp. keeps them in alignment.
7. Remove board and finish processing.

The boards I normally do are between "tiny" (would you believe 1/4" x 3/8"?) and about 4x6 inches. I get adequate alignment to do 40 mil (1.0mm) pads drilled with a #80/13.5 mil hole (0.3mm) (to put "via wires" in). I'd say the alignment is _usually_ within about 8 mils (0.2mm), but occasionally I see it off by twice that.

Cheers,
Tom

> 1200 ohms.

Hi Reg,

Could you help me out here a bit? I'm not getting a very good mental image of where you are saying this feedpoint resistance is. I would expect a resistance to be between two terminals, but I don't see two terminals here...I can imagine putting a gap in the horizontal wire and measuring an impedance there, but that doesn't match my picture of what J-M was describing.

My image of what Jan-Martin wants to know is the impedance at the feedpoint, which is at the bottom of the (presumably vertical) wire tapped onto the horizontal wire, measured to ground. Is that correct, Jan-Martin? How high up is the horizontal wire? How long is the vertical wire, actually, and is it really vertical? What are the wire diameters? What sort of ground/counterpoise will you be feeding it against? If indeed this is the right interpretation of the situation, NEC might be a decent solution. Surely the vertical wire will do significant radiating. But the horizontal wire should also be excited in a radiating mode...the sum of a radiating and an essentially non radiating mode?

(Tried to see the info at
http://www.deja.com/[ST_artlink=www.nuav.net]/jump/http://www.nuav.net/batterievara.html, but it's not coming up right now...)

It would be usual to use transformer coupling at both input and output
to get what you want. Have you done a web search? I got all sorts of
hits by putting "vacuum tube microphone preamp" into www.google.com.
I'm not going to check them all for you, but this site:
http://www.us-epanorama.net/audiocircuits.html
has quite a lot of stuff on it. Son of a gun, look at that! A link
there took me to a preamp design, bal. 600 ohm in/out, pair of 12AX7's.
$100++ of audio xfmrs, but maybe you can use cheeep ones if wide freq
response isn't important.

Cheers,
Tom

A hearty thank you to all who have replied to my original question that started this thread. For those still following it, I have the following response to some of your suggestions:

1) yes, I had the gut feeling the 14.8vac 25 A transformer would be a bit thin on voltage for this supply, but it was a surplus item at a fantastic price and I was unable to find anything so hefty at anywhere's near such a reasonable price! I'm going to continue to try to make it do.

2) I have 40,000 uF worth of filter capacitance so I believe I am getting peak voltage out of the rectifier.

When wiring up the supply I was short of decent gauge hookup wire, so intend to rewire all the high amp lines with 12 AWG because I have noticed some voltage drops from one end of the supply to the other. That should help somewhat. Then I intend to either add a second voltage boosting transformer or to replace the four 2N3055's with 2 higher amp pass transistors to reduce total voltage drops. I may also replace the LM317 regulator with an LM2941 that has only 0.5 volt dropout. The 35 amp bridge could also be replaced with low voltage drop Shottkey rectifiers as a final assault on the voltage drop problem. Thanks again for the many suggestions!

The first question that comes to mind, Do you have more than sufficient
power to develop the desired plasma?

Does the plasma have to be stable and is it with the current configuration.

If you do(and it is) , then I'd forget about the extra work.

We used to use RF generators over a wide range of frequencies and purposes.
Under some operating conditions we'd see an SWR of 13:1 or even higher.
Normally we didn't even pay attention, but I was curious so I checked a
couple of the units out.

Virtually none of them had stable loads and some of the generators had
variable link coupling. We normally just left the links set for maximum.

The lowest power generator was 2 KW and as I recall the highest was on the
order of 125 to 175 KW. We even had a 160 KW electron beam inside a vacuum
chamber large enough to almost stand in.

We also had a couple of plasma units that could darn near make you deaf.
These discharged into the room instead of a vacuum chamber.
They certainly were no where near as quiet as my plasma cutting torch.

4309. Re: phase noise question, Allen variance

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-19 05:57:21 UTC
From: Richard Karlquist <rick@area.com>
Message-ID: <5NC%5.6171$A06.234826@news1.frmt1.sfba.home.com>
Source record: 55986

Allen variance is equal to the square of Allen standard deviation. Most literature, including the
papers cited, talks about Allen deviation, which is denoted sigma, subscript y, of tau.
Dave Allen calls it "two-sample" variance.

This doesn't have to be about belief - you can easily calculate it.

The rectifier diodes only conduct in pulses, in those parts of the AC cycle when the transformer voltage is higher than the voltage on the filter cap (plus diode voltage drops of course). The rest of the time, the diodes are reverse biased and you're living on the stored charge in the capacitor.

The calculation is in 'The Art of Electronics' by Horowitz and Hill, which has an excellent chapter on power supply design. Cutting to the final simplified formula:

V = 0.008 * I / C

where V = peak-to-peak ripple voltage
I = DC current
C = filter capacitance in farads
0.008 = constant for 60Hz supplies (0.010 for 50Hz)

For your case, where I = 20A and C = 0.04F, V is 4.0V peak-to-peak! You're only "getting peak voltage" at the top of the cycle. In between, you're getting 4V negative spikes. The tip of each spike bring the regulator input below its drop-out voltage, so the averaged DC output drops below the value you set. The more current you draw, the worse this gets.

What you'd see with a 'scope on the output is not a smooth DC voltage, but a DC level with negative spikes every 8.3ms where the lows of the ripple voltage "drop through" the regulator.

The resistance is that measured between the antenna end of
the single feedwire and the point on the half-wave dipole
wire to which it is connected. ie., it is the antenna
feedpoint resistance.

We live in a hilly part of NJ covered by "Third World Electric" - so I've two generators. One suggestion I would make is getting a better muffler - I was able to buy a Caterpillar aftermarket muffler for the larger of the gennies and it makes a big difference in the amount of noise. However, when the power goes out you hear them all over the neighborhood. A good muffler/exhaust will help efficiency

If PlugPower ever gets its reformer working you will be able to generate DC right off the natural gas line - unfortunately only at 37% efficiency.

Don't get crazy, but EBay ocasionally has humongous generators for sale - the Fairbanks Morse kind which will backup a hospital or nursing home!

General Electric Power Systems has announced 2001 availability of a
fuel cell UPS that runs at 38% on propane and 40% on NG. What is the
efficiency of a gasoline engine? I can't believe that it is as high
as 38%? Multiply that by the efficiency of the generator and it goes
down even more. The GEPS set has no moving parts, is about the size
of a large refrigerator, runs at about 64 db and needs a major service
only every four years. Oh yes, it puts out 7kw continously.

Message-ID: <91oacdggu1@neptunium.btinternet.com>
Source record: 55995

I could have added that a tap on the antenna wire
corresponds to voltage-fed arrangement. When the tap is
right at the end then voltage feeding is quite obvious.

When the antenna wire is cut at some point into two parts
and fed via a pair of wires across the gap, it then
corresponds to a current fed arrangement.

This is just another way of looking at simple dipoles. Note
that if feedpoint resistance and radiation resistance are
considered to be synonymous, then radiation resistance
varies all over the shop and depends on the point on the
antenna to which it is referred and whether it is voltage or
current fed.

Life gits complicated doan it ?

Something to keep in mind when dealing with RF plasmas is that they are not linear devices. You may be shipping it power at the standard ISM frequency of 13.56MHz, but the chamber is likely to be generating a series of harmonics. If your generator to chamber interface includes a matching network, its effects at other frequencies become an issue as well. For instance, a resonance near a low - integer fractional ratio frequency can result in parametric energy pumping and undesired plasma modes. It also results in the length of the coax feedline affecting the operation of the system (which it wouldn't if it was matched and only had a single frequency involved).

RF plasmas are surprisingly complex beasts to keep well controlled over a range of processes. Best of luck with your system!

==========
The antenna Jan-Martin , LA8AK has described is shown in The ARRL Antenna Handbook , 18th edition , page 7-20
Overall length there is 130 ft for a fundamental freq 3750 KHz ,with single wire feeder 47 ft from end (14% off centre) brought into the station.
Feedpoint is between end of single wire feeder and earth.
The antenna is also effective on its harmonics . Length of feeder is is not discussed.
It is commented that <quote> Because the feed line is brought to the operating position, "RF in the shack" and a potential radiation hazard may be experienced with this antenna <unquote>

Ah. So the vertical wire (single feedwire) has antenna currents on it and is part of the antenna system. Perhaps Jan-Martin can let us know a bit more about the actual proposed system, and where it will be fed. The picture of feeding it 15 meters up in the air, between the vertical wire and the horizontal one, isn't the one I have in my mind; rather different modes may be excited by feeding it there or at the bottom of the vertical wire against a counterpoise/ground system.

What is being said here, is that the radiating portion of
the antenna can achieve resonance (ie efficiency) at the
fundamental and harmonics but the feedpoint impedance is
something that must be adjusted via a tuner. The feedline
is indeed a factor, but something that can't be calculated
for every individual installation.
Translated, that means that the "bulk' of the antenna will
be efficient with a normal feedline length.
This is par for the course in old texts where matching to
50/75 ohms wasn't an issue. The concept is still valid...if
your tuner will match it to the radio in question.
Nowadays the trend would suggest to use a 9:1 transformer at
that off-center junction to achieve a relatively closer
match for a coaxial feedline...and for broadband SWL use, a
tuner would still be recommended.

At the dipole resonant frequency the feedpoint resistance is
the same as the feedline Zo - approx 600 ohms. So the line
is properly terminated and it has no standing waves. If it
has no standing waves the single-wire line radiates very
little. It is the dipole which does the radiating.

The input impedance of the correctly terminated feedline is
an unbalanced 600 ohms which can be transformed to an
unbalanced 50 ohms very easily.

At all other frequencies the feedline has a large but
low-loss SWR and radiates. At low frequencies it behaves as
a T antenna or a capacitance-loaded vertical.

On all bands higher than 1/2-wave dipole resonance it will
radiate with high efficiency but with all sorts of input
impedances and with wierd multilobe radiation patterns.

Reg.

Hey, I'm not worried - it's you who have the problem!

There's nothing wrong with your choice of filter capacitance. I just assumed that you couldn't possibly have known how to calculate the ripple voltage, without also being able to calculate that a 15V transformer never had a hope.

Transformer output: 15V RMS on full load
Peak AC voltage: 21.2V
Voltage drop in rectifiers at full load: at least 1.5V (bridge has two diode drops in series)
Peak-to-peak ripple: 4V

So, input to voltage regulator at bottom of ripple waveform (optimistically, without any allowance for voltage drops in the wiring, or routine reductions in mains voltage): 15.7V

Chance of a conventional voltage regulator delivering 13.8V @ 20A, with no dropout: 0

Someone just gave me another coaxial antenna surge protector (names like Alpha Delta and TranSorb come to mind, but the one I just received shows no identification at all: it's a little ceramic gizmo with a grounding screw on one end and it plugs into a T connector on the other end), and I'm curious: how can I tell if it/they are good or bad?

I can put RF into one end of the T and see if any comes out the other, but that won't tell me anything about the "protection" capability.

Assuming that the surge protector is a gas style:

The use of a variac and an AC amp meter could tell if the surge protector is working.

By placing the amp meter in series with the variac and connected to the antenna side of the connector, you should be able to apply voltage to the connector and once you hit the breakover point (surge limit), you should see a current being drawn from the surge protector. This will indicate the unit is working, unless it has an extremely high voltage breakover point. I think most of them break over around 90 Vac. They basically use a neon lamp across the connections of the coax. Once the voltage reaches 90 V the neon gases get excited and become conductive and short the voltage to ground.

Assuming that the surge protector is MOV style.

Use the same procedure above except add a 100K ohm resistor in series with the surge protector. This will protect the MOV from excessive current draw and perminate damage.

Hope this information helps...

4333. Re: halfwave VS1AA antenna impedance

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-20 21:29:37 UTC
From: tom_bruhns@agilent.com
Message-ID: <91r8bonit1@nnrp1.deja.com>
Source record: 55911

Hmmm... FWIW, the model I looked at had pretty significant current on the vertical wire, similar in magnitude to that on the horizontal wire, even when the fundamental mode of the horizontal wire was excited. And the current distribution did indeed change somewhat, though not as much as many other configurations, when the excitation was at the top rather than the bottom of the vertical wire. I didn't have to take it very far off resonance (for the flat top) to end up with more current in the (15M) vertical wire than in the flat top. "YMMV" and any actual installation will undoubtedly be different than the model.

The feedpoint impedance, using the bottom of the vertical wire against a perfect infinite ground, was in the couple-hundred to thousand ohm range, with significant reactance dependent on frequency, on 80, 40, 20 and 15 meters; it was a bit nastier but not unreasonable on 30 meters.

As someone else suggested, build it and expect to match to something in the few hundred ohm range at the base of the vertical "feed" wire. It's really not going to be as nasty as matching to the same thing over an arbitrary length of coax which might reflect back anything between a few ohms and hunderds of ohms.

Thanks to everyone of you.
I've got an idea about it, seems I have to modify the atu,
believe it is important as Frank quotes for the unbalanced antenna
"RF in the shack" and a potential radiation hazard may be experienced
with this antenna

the antenna was popular around here in the fifties, but later, with
tellies and hi-fi equipment it became unpopular, particularly since
the transmitters usually consisted of a parallell tuned tank circuit
with tappings on link for antenna connection. The antenna was often
grounded via the transmitter.

For the same reason I wouldn't prefer a 9:1 balun inside the house,
but it is no problem where I will use it, with 50-100m coax cable,
likely to be 75 ohm RG11 just to get to the outside of the concrete
bunker

wonder if 1/3 Hertz, W�WO- or Windom antenna may be balanced or
unbalanced, and has still the same name(s), just a different age?

73 es happy xmas

I was thinking about building a pair of 3-500Z in an amplifier.
The tubes use 5volt filaments. I have a 10volt CT transformer
that would handle the current just about right. Is there
any consideration in putting the tube filaments in series? I
suppose I could just put each side of a parallel wound choke
to each tube filament. Would there be any sort of problems
with unbalance - rf wise?

Thanks, Doug

4340. Re: Linear Amp - tube filaments in series ???

It should work OK since you're using the transformer secondary centertap for RF ground return. The xfmr needs to handle the same 15 AMPS.

The model take fully into account both wire diameters.
Anything modelled above a perfect ground should be treated
as highly suspect. And antenna computer programs should not
be worshipped as immaculate Goddesses.

The model must allow the connecting point of the feedline
to slide up and down the 1/2-wave resonant antenna until
there is an impedance match. There must be no standing waves
on the single wire feeder.

On any other band the antenna will spray it all around
efficiently but indiscriminantly with input impedances
coming out of Santa's lucky dip bag.

What else is there to expect from a couple of random length
wires, one joined to the other. Its a waste of time trying
to analyse behaviour to any greater extent.

Hello--
Note that the site's text is in Hungarian(?) but fortunately, the Universal Language of schematic diagramming mostly bridges the gap.

The radio in question (featured in the top-of-page GIF image) consists of a crystal detector followed by two stages of op-amp audio. You can experiment with the tuning components to cover the band you're interested in receiving.

Don't worry, Reg, they aren't.

Thanks for your viewpoints on this antenna. I do appreciate where you are coming from on it, I believe, and your thoughts have given me some nice insights. I appreciate that. -- It remains interesting to consider just what currents are on what wire segments, however.

Merry Christmas to all!
Tom

Someday I hope to find enough round tuits to build an amplifier which
used TEN 12-volt tubes (1625's?) with filaments in series across the AC
line, as described in one of the ham magazines maybe 20+ years ago.
The article claimed it worked well on the lower bands (that many tubes
in RF parallel contributed too much capacitance for the higher bands).

Also once you have your VX-5R you can easily build a CW or DSB transmitter,
run the carrier
signal at all times during receive and this acts as a BFO on the VX-5R set
to AM. The bandwidth
is a bit wide, but it works very well, even on HF, which the VX5 also
covers.

I am just now getting back into the 11 meter hobby again since i recently got a computer, so I dont even know if im in the right newsgroup. Can someone please email me back and point me into the right direction of location newsgroups,chatrooms,and or websites that sell linear's. Also I used to have a 4 tube linear but am wondering if i should go with solid state now. Wonder which is best.
Thanks in advance, Steve

Howdy Larry......sounds like you've gotten some good suggestions (liked the rule of thumb for cap's). My "try" for your supply would be to merely drop the driver transistor and run the output of your 3A rated LM317K directly to the bases of those pass transistors - This is where your overhead is being lost in my opinion as the junction voltage drops and the overhead for your LM317K is cumulative. You might want to beef up the heatsink for the LM317K however but I've built such a supply with a late friend of mine (similar specs) and it worked fine. One thing about doing this, if you can get away with it (i.e. acceptable output performance) is that your heat dissipation in those pass transistors will be minimal compared to the tried-n-true way of using the higher input voltage.

Best of luck - KEEP ON TINKERING.....THAT....is REAL HAM RADIO

Howdy Robert.....You're quite correct in your stating that the (no load/light load) voltage of the filter will be 1.414 x RMS, and this is a good value to keep in mind for rating of components but in fact, once loaded, I've found it better to "plan" on the worst-case DC output to be something closer to the RMS value before filtering, allowing for ripple. I'd "plan" on this value as being the lowest value for regulator overhead.....what say others?

The voltage will drop well below 1.414 x RMS as you apply load - the more load the lower the minimum voltage. The larger the capacitors the higher the minimum voltage under full load. The 2000 ARRL Handbook (probably earlier years too) has a good explanation and formula that will get you very close to real values of ripple for a given load and capacitance.

>If I feed my Icom 2N handheld 144 Mhz transceiver with just a very
>long wire (say 30 feet) instead of the ducky, will I get a longer
>distance transmission (my goal) , and would the wrong SWR in this case
>damage the set?

Feeding a random wire as you suggest will not work without a matching network, unless the length of the wire is an odd multiple of 1/4 wave at the operating frequency. In theory, you could use a wire antenna that's an odd multiple of 1/4 wavelength, fed against a good ground, and it should match 50 Ohms. In theory. On VHF, antenna height is very important, as propagation is line-of-sight. You would be better off to build a simple 1/4 wave ground plane antenna, feed it with good quality coaxial cable, and install it as high up as you can get it. You can easily build the antenna using an SO-239 flange-mount jack and some thin brass welding rods. Make the vertical element 19-1/4" (49mm) tall, and make the radials 5% longer than that, and droop them at a 45 degree angle. Pay a visit to your public library and see if they have a copy of the ARRL Radio Amateur's Handbook (any edition) or the ARRL Antenna Book (any edition). You will learn all you need to know to build simple antennas from either of those books.

The commercial "atomic clocks" and other devices that receive the 60KHZ WWV signal all appear to use a ferrite rod with a coil in the center. Just where you get the ferrite rod is the question. Try Fair-Rite or Steward. I've had some success using half of a flat ferrite that was intended as an RFI suppressor for flat ribbon cable. You could use superglue to glue the halves together and possibly boost the performance. But ferrite is definately the way to go for 60KHZ.

Hank
I have built several active FET/ ferrite antennas, for both 60 and 100 KHz, for Loran C, with great success.
I usually go for the balanced type as it seems to pick up less qrm from tv time bases and harmonics of the power line frequency.
What works for me is to fill the ferrite rod with a bifilar winding of two lengths of the fine teflon covered wire that is used for wire wrapping. Either one or two layers. Obviously the bigger the rod the better, a good source is old transistor radios. 25c at a garage sale, the last one cost me. I use a couple of J310s or similar. It is easier to wind the rod and then tune it on the bench, rather than try to calculate inductance etc., even if you know the characteristics of the ferrite.

I use a signal generator into a little loop a few feet from the loop antenna, with a scope across the tuned winding. Resonance can be very sharp. Add capacity as needed. I've had bandwidths of less than 1 KHz, which is fine for 60 KHz, even desirable for WWVB, but you may need to broaden it with a parallel R for Loran.

The amplifier is standard stuff, values depend on your fets. I take the output from a tuned transformer, drain winding bifilar again, output link to match 50 Ohms. The supply voltage can be fed down the same coax, and is available inside a lot of receiver/comparators anyway. But beware the hp 117, this feeds 35 Volts down the cable, but it can easily be dropped to 12.

All this can easily be housed in standard plumbing plastic, see your local Home Depot or whatever.

Also now there are easily available 60 KHz crystals for round about $1 from epson and elsewhere that make really nice filters,

Do not expect high signal levels from WWVB, I find it hard to see the signal on a spectrum analyser here in california, even since WWVB went QRO. But if the little RS clock works, it can be done :-)

i'm building "A Quartz Watch Time Base Monitor" as described in RF Design 10/25/90..
this circuit picks up the 32768 cps oscillations from a quartz watch and with a counter the article indicates that you can set the watch trimmer so the watch is accurate to within one second a year..
by trial and error i've been able to set my citizen world timer to about a second a month..
but that takes too long..
this circuit calls for a radio shack 273-064 piezo buzzer element ...
the resonant frequency is listed as 6.5 kHz and i'v e heard that it's not real sensitive at 32.768 kHz.!
anyone got any ideas for a better transducer?
tnx & 73
hank wd5jfr
ps: the 60kHz loop will be used with wwvb to calibrate my counter...

4368. Question about AD9854 initialization

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-22 17:48:25 UTC
From: Craig Johnson <cbjohns@mn.mediaone.net>
Message-ID: <92045d$278h$1@si05.rsvl.unisys.com>
Source record: 55944

I am also working on an AD9854 project which will be used as a
VFO for a HF radio. I am running it from a PIC16F877.

Recently several of you have mentioned that the Internal Update
Mode of the AD9854, as it runs in default mode, is not the
desirable way to run it. You mention that you run it in Internal
Update Mode only long enough to get it disabled and from then
on you issue raise the I/O UD line when you want it to update.

My question is why this is more desirable. To me it seems easier
to just feed it a command and 6 bytes, for example, and let the
AD9854 automatically change to the new frequency when the
6th byte is received by the AD9854. Is this less reliable?

I am also having trouble getting my AD9854 to initialize properly.
I send a Master Reset, an IO Reset, a CR_Write command (0x07),
and 4 initialization bytes, but it does not seem to initialize properly.
The 4 CR bytes I am sending are (in hex): 10 20 01 40. Then I send
a frequency update command (0x02) and 6 bytes, but I do not see the
I/O UD command come up indicating it got the update. It also does not
seem to put out any signal at IOUT1. This has be confused.

Any help would be much appreciated.

- Craig, AAZZ

Source record: 55945

Both Dean and Tim have excellent suggestions, but I would
recommend that you go for the 1/4 wave dipole rather than the
J-pole, if you do not have an antenna analyzer, such as the
MFJ-259. Getting the exact feedpoint can be a little tricky
with the J-pole.

Dean's idea was this:
You can easily build the antenna using an SO-239 flange-mount jack
and some thin brass welding rods. Make the vertical element 19-1/4"
(49mm) tall, and make the radials 5% longer than that, and droop them
at a 45 degree angle.

I find that stiff wire can also be used successfully if you do not have
access to welding rods.
I too wish you good luck. Perhaps you can even try them both out.
Al, N2NKB

4370. Re: Linear Amp - tube filaments in series ???

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-22 18:57:47 UTC
From: Skipp <skipp@pilot.ucdavis.edu>
Message-ID: <92087b$6eb$1@mark.ucdavis.edu>
Source record: 55946

Hi Doug,

Yes, you can easily run the filaments in series. Kenwood did
it with their TL-922 amplifier. It might be worth your while
to locate a diagram for the 922 to use as a guide. Try Rich's
web site at http://vcnet.com/measures for some additional
amplifier information.

When you run the filaments in series, your choke won't have
to handle as much current as the parallel unit, that's kind of
helpful. The series current is the single tube value. As an
example, if you tube draws 5 volts at 7.5 amps, the two tube
series current value is still 7.5 amps.

If your concerned with rf balance, have a look at the Kenwood
approach which employs a "third winding" in the choke. Conventional
methods work fine, just use examples like the ones shown on
Rich's web page. Maybe I should include some 3-500 circuits
on my Amateur Radio Pages on the http://sonic.ucdavis.edu
server. Lot's of other types around for you to see.

Hope that helps some...

cheers
skipp@pilot.ucdavis.edu

Suggest you visit Lyle Kohler's web site, http://www.cpinternet.com/~lyle/
, where you will find some info and lots of links. Lyle is into
somewhat higher frequencies, but the same principles apply. The program
Reg suggested is very nice to see what sort of loop might give you the
performance you want.

I just built the balanced JFET preamp that's on Lyle's site, with a
remote-tuning system that feeds power and tuning in the same coax that
runs back to the receiver. The preamp seems to work well with a
center-tapped loop.

I can "see" WWVB quite easily with a few feet of wire as an antenna on a
spectrum analyzer, here in Washington near Seattle, but a large loop (or
one on a large ferrite rod) should help get a clean signal.

Cheers,
Tom

4373. VHF amplifiers

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-22 20:48:13 UTC
From: angry_beard@my-deja.com
Message-ID: <920emb$r32$1@nnrp1.deja.com>
Source record: 55799

I've just started reading up on VHF electronics, and I've noticed an apparent preference by designers for lowpass rather than bandpass filtering between stages. If an amplifier circuit is designed specifically for one frequency, is there any advantage of a low pass filter? I can understand the benefits if a more generalized frequency response is desired, but even then the filter (usually chebyshev??) is designed so the frequency of interest is perched atop the final ripple in the passband, so the advantage would seem to be reduced. A tank circuit used as a collector load would seem to give many advantages (simplicity, size, efficiency, easier tuning etc.) over the more complex lowpass designs - the only difficulty I could think of offhand would be that it might be harder for the circuit to be "pulled" to a different frequency. Is there a rule of thumb for this?

Also, I noticed that a cap is often used to bypass the emitter resistor to increase signal gain. I was wondering if it was possible to replace the cap with a series LC circuit tuned to the frequency of interest for more specific frequency boosting - this would seem to solve some of the additional power dissipation caused by non-linearites being reflected back onto the transistor.

Anyway, I'm just learning :)

Thanks,
iir

Ferrite rods can be found is scrap BC medium wave radios often combined with
an FM radio.
Should be available in many junk boxes at (radio) flea markets.

4375. BJT Oscillator Design

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-23 01:02:09 UTC
From: Matt Donohoe <m_donohoe@dingoblue.net.au>
Message-ID: <3a43f9a6$0$7495$7f31c96c@news01.syd.optusnet.com.au>
Source record: 55801

Hello I am wanting a page like or some kind of formulas like on www.electronics-tutorials.com to design a BJT Oscillator, any frequency and any transistor, but it needs to have the formulas or methods for correcting the schematics, I have a basic understanding of LC, Resistor divider networks and basic LC Circuits using FET's as the oscillating transistor. This limits the circuit to about 1GHz+- Which is something I want to avoid and move on...

Anyway

Please help if you can!

Matt Donohoe

4376. Know any Aussie homebrewing Newsgroups??

G'day
Anyone know any Aussie homebrew newsgroups??
Surely there is enough aussie brewers here to start one?

Cheers

Martin

You could try a 32khz watch crystal though the design will attempt to
minimise acoustic coupling to the crystal the highQ will "magnify" the
acoustic signal in the required frequency band.
The 3db points will correspond to a Q of 20000 or so.

Might check with Amidon. Their catalog lists some fairly large rods,
though they don't always have them in stock. I've also heard of folk
stacking a number of smaller ferrite pieces...for example, a bunch of
0.8" OD toroids...and gluing them together. Even tiny gaps are a
problem if the whole magnetic circuit is supposed to be in ferrite (so
gluing a cracked toroid back together usually is a poor idea) but the
antenna rod completes its circuit in air anyway. The effective
permeability shouldn't be compromised too much by gluing up a stack.
See the Amidon catalog for some more info on effective permeability of
rod antennas.

Cheers and Merry Christmas,
Tom

the crystals are in a metal can the diameter of a matchstick ususaly
with two leads out of the end take an old watch to pieces.
Terminate the crystal in a gain of 10 op amp stage with 1 to 10 M ohms
input.
The acoustic energy will get through the metal case.

Hi,

I'm looking for plans or any related info (even a kit) for
a crystal radio that will drive a loud speaker. I've seen
this done in the past, so I know it's possible. Any
info on this subject will be of great help.

Thanks for answering here.

Regards,

Pez

There's a place called Pasternak that would likely be able
to fulfill such a request. Dunno a URL, but a search may
reveal them.

I don't know of a newsgroup, but there is a Heath mailing list that you might check. You can subscribe at:

listserv@listserv.tempe.gov

Put only "subscribe heath 'name' 'call'" in the subject line and body, no quotes.

You can go thru their archives at:

http://www.tempe.gov/archives/heath.html

My bookmarks show them to be at www.mfjenterprises.com, although my browser says the site is down. Perhaps they are doing some work.

LDG has a nice range of tuners http://ldgelectronics.com/, mostly automatic, tho. Also, SGC has quite a range of ATUs, but very pricey (IMO) http://www.sgcworld.com/

4395. NEED HELP! Info on K1FO vhf/uhf Amp

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-24 16:07:47 UTC
From: Bob Dodson <wb5apd@alltel.net>
Message-ID: <3A461F53.25C52D5@alltel.net>
Source record: 55821

Need your help bad. I need to know what material is used in a K1FO
vhf/uhf
amp for the plate line. Type of material and thickness etc. The K1FO amp
plans are in one of the ARRL UHF Experimenters handbooks.
Need to know real bad type of material, thickness etc etc. Also
if you
can find this information on the K1FO 432 version vs the 2m or 220mhz
version would be even better. Mainly need to know what the plate line is
made from,
don't need the diminsions.
Want to replace this aluminum plate line with a material that has
better thermal
stability. Also any ideas on what material is best for a strip line amp
(plate line)
would be interested in your thoughts on this. Mainly trying to fix
thermal problems.
I have tried a differential capacitor but think my main problem is the
aluminum
material used in this plate line.
Thought maybe if I went with the exact material used in a K1FO amp
would solve my problem.
Merry Christmas and thanks for any help in advance.

Go to www.Google.com and search for MFJ. The site comes up as the first listing. Google is the most astonishing search engine I have ever used.

4400. Antenna called Thumper? Help!

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-24 22:37:55 UTC
From: jpoulin@honk.org
Message-ID: <3a467a5d.1322995@news.flfrd1.on.wave.home.com>
Source record: 55827

Greetings Everyone,

I have been hearing some talk about a home brew antenna
called the "Thumper". Its a 3 or 4 element beam that
has a 1 foot boom.

Has anyone heard about this before?

If so, does anyone have the specs and measurments?

Thanks for all your help.

Thumper....
1 foot boom.....hmmm....3 or 4 elements....uh huh....if it ain't for 432 I would suspect you're into the home brew brew. :-)

For 1.9 GHz, you should probably use "polyiron" instead of ferrite.
Available from suppliers
such as Emerson and Cummings.

You can use a PIN diode switch, depending on the power requirements.
Here is a commercial source of PIN diode switches:
http://www.mini-circuits.com/npswitch.htm

This site by Charles Wenzel had a design that fit your
needs: http://204.251.59.186/Notebook/crystal.htm
The site is down right now, so I don't know if it still
exists. It uses a TL431 shunt regulator (looks like a
transistor) as the AF amplifier for the crystal detector.

I don't know about N5 land but there is a good homebrew net on
this side of the Atlantic. 3.727MHz SSB, afternoon & early evening.

If you can't find a regular HB net, you should consider starting one
yourself. If the messages on this NG are anything to go by, there
are a lot of keen home brewers out there.

Question - if a "crystal radio" contains an AF amplifier to drive a
speaker is it still a "crystal radio"?

Message-ID: <Ywb26.32855$nM5.6050646@news02.optonline.net>
Source record: 55846

Craig,

first - why I don't use internal update:

The problem with the internal update clock is that you don't know when it's going to fire.

If you are feeding a six byte frequency update into your dds chip and the update fires after you have three bytes into the chip you will get a frequency register that has three new and three old bytes in it.

This may not sound like much of a problem, but consider the case of crossing from 100 to 0111 as your high nibble in the tuning word. Things could go pretty weird with half the old tuning word in there.

second - getting the darn thing to work at all:

The easiest way I know to get the thing initialized is:

1) just do the hard reset and stop.

2) check the internal update clock pin, it will be an output at this point with a pulse stream on it.

3) now only do the load to the control register to turn off the internal updates. This one will load in with the last internal update clock pulse.

4) check the internal update clock pin to confirm that there are no pulses on it any more.

5) now go back and turn on the update clock. This time you will have to drive the clock pin as an input.

6) the magic pulse train should be back

The ICD for the PIC is a good way to do this single step stuff.

Hope this helps

Use a ferrite rod from an old AM radio.
Use your function generator to resonate the
rod (by choosing the right parallel connected
capacitor) to 60KHz. Be forewarned that the
rod will have a pretty sharp peak at 60KHz.
It's easy to de-tune because it's fairly high Q
and thus has a narrow bandwidth. It will also
be directional..point the rod at the station to
find the null and then turn it 90 degrees for
best reception.

I can't help you with your second question, but I can with the first. The size of the wire has very little effect on either the inductance or Q of a winding on a ferrite or powdered iron core. You'll see almost no difference until the wire gets nearly hair-thin on the one end or so large it won't conform well to the core (or all the turns fit on one layer) at the other.

HP Pen Plotters go for about $25 on EBay. Why not just use the pen plotter to trace the outline and then ago over it with a fine waterproof marker? I use a waterproof marker to clean up the traces anyway, so this should work fine. Has anyone out there done this?

I read about it one/two years ago. Maybe here. Dejanews probably has
the comments. The guy even specified the ink+pen he was using and
mentioned that in his plotter (don't remember which) he could just
place the PCB material directly in the plotter.

Off your topic a bit, but your mention of the power levels reminded me:

I used to participate in beacon experiments run by Paul, AA4XX. During one of these, while he was running 2 milliwatts into the antenna on 40 meters, I copied his signals off the back of the wire beam he was using. Distance was 243 miles.

Paul would send a "code" word of 4 letters in CW and the receiving stations proved they had copied him by sending him the word via email.

I have the certificate for this on the shack wall. I think I did better later, but don't know where that certificate is.

Lots of guys were copying his beacons, and most of them did better than I. He would vary the power level down to a hundred microwatts or so, and use a different code word at each level. Some guys closer to him actually copied these lowest levels!

The code word was repeated many times, so you had several shots at it over a period of hours, and you could wait until propagation favored you.

He might still be doing this. It was all coordinated through the QRP list, and was mentioned in QST magazine.

But if you use IOUD as the "master" control pin to your micro and set the
uC update loop (or Gate Array) to be faster then the next IOUD pulse. Then
the updates are completely synchronous with the master clock. Pretty
cool in hopping applications, expecially if the sequencer is fast hardware.

BTW, I have an "own_ioud_pulse" in my software, similar to yours.

4436. Re: Question about AD9854 initialization

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-27 20:46:10 UTC
From: Craig Johnson <cbjohns@mn.mediaone.net>
Message-ID: <mys26.6400$RB2.125634@typhoon.mn.mediaone.net>
Source record: 55863

Bob,

Thanks much for the good info.
(By the way, I am using the Microchip In-Circuit Debugger for the
PIC16F877. It works great! Don't know how I could debug this
thing without it.)

I just tried your suggestions, as I understand them. I did the hard reset
(Master Clear) and indeed I do see the stream of I/O UD pulses
appearing. Mine are every 2.4 us or so. (60 MHz clock.)
I then send the Initialization string in serial mode (4 bytes to address 7)
and
the stream of I/O UD pulses stops, as you said.

Now I have to change my PIC driver board to be able to send over the
I/O UD signal to tell the AD9854 when to do the frequency update.
Board change in progress.

Now some more questions, of course.

1) Do you run in parallel mode, or serial? I am running in serial mode,
and wonder if this may be part of the problem. Maybe there is more
control if run in parallel mode.

2) When you say "do the load to the control register to turn off the
internal updates." do you mean just the single byte to address 1F
(parallel
mode). I am sending the 4 bytes to serial address 7. OK? Is this
less reliable? Could I end up with a partial update if the I/O UD pulse
happens in the middle of this 32 bit transfer?

3) I think I should be able to read the initialization bytes back by using
a command 87 and bringing 4 bytes back with 32 clock pulses. However,
this has not been reliable, and has lead to some of my confusion. Is this
not a good thing to do?

I see I completely misunderstood the usage of the I/O UD line. I
thought the AD9854 would simply wait for the 6th byte of the frequency
update data (based on the command received) and then internally generate
the I/O UD for that update. Looks like this is not true.

Thanks for helping me to understand this, Bob!

I have run the chip both ways. Either way it's a pain. If I had it to
do again I would go serial.

>
> 2) When you say "do the load to the control register to turn off the

The idea is fewer bytes = less debug to do. Generaly the problem is an addres that's off one, or a data word that is backwards or something like that. If you do it with one byte to one address it's easier to debug.

Is this
> less reliable? Could I end up with a partial update if the I/O UD
pulse
> happens in the middle of this 32 bit transfer?

That's the concern I have always had. If you do a 32 bit transfer and the update just happens to be in the middle of the transfer you could have part of the 32 bits moved and the rest left hanging.

>
> 3) I think I should be able to read the initialization bytes back by

However,
> this has not been reliable, and has lead to some of my confusion.
Is this
> not a good thing to do?

I have never tried it. There's something in the doc's about it not being a good idea.

I wish it worked that way. If it did then I would use it. The only way I see to make it usefull is to sync up an external device to the ioud line. Not a bad idea with a gate array, not so easy with a PIC.

Source record: 55865

Bob,

Thanks for the good information!

I am still confused about a few things, however.

When run in serial mode, how does the initializaton sequence
work? It sounds like the I/O UD could truncate the bytes
for this command also. This is certainly different than what is
described in the product description.

I am starting to wonder how serial mode works at all! Now
I am leaning toward parallel mode, so I can turn the default
Internal Update off with a single byte transfer with one clock pulse.

I also understand why you guys in another discussion in this
newsgroup were finding the default of Internal Update to be so
strange. It truly sounds unworkable.

Is the I/O UD pulse frequency a product of the AD9854's
clock? Some sort of frequency division? Or simply an RC
time constant? My clock is 60 MHz, which would be a period
of 16 ns. If frequency division were used, it would appear to
be a divide by 150 or so. Just curious!

Thanks, Bob.
73,

Craig, AA&#65533;ZZ

Source record: 55868

Craig,

The internal update clock speed is controlled by a register (hex 16 to hex 19). It is divided down off of the DSP clock / 2. The default looks like it is a divide by two and then a divide by 64 giving a net division of 128. If you set the internal update to be to fast (divide by < 5) then there is no pulse out the pin, but you are still on internal. I'd recommend staying away from that register (serial register 5) if you are in serial mode.

Serial mode works just fine. The only time you have to worry is when you are switching the update clock. To take care of it simply send the defaults for everything *except* the io update bit the first time you load serial address 7. That way regardless of when the update clock hits you it will be ok. An alternative would be to send what you want to the control registers and then re-send it after you are in external update mode.

The new (9/2000) data sheet also has another way to do this : don't turn on the ref clock until you have the io update bit in the right state. How they reconcile this with all the previous yack about reclocking all the i/o I have no idea. I'll bug them about it - maybe get another back pack or something :)

Enjoy!!

Bob

Bob,
Thanks again!

I did some experimenting tonight. First I tried playing
with the Update Clock registers (serial register 5). I doubled
it from 0x40 (default) to 0x80. Sure enough, my I/O UD period
doubled also. Now I understand this.

I then reworked my PIC board to use another output pin to
send the I/O UD to the AD9854 upon command. I then
reworked the code. I tried the method of sending the Init
bytes twice, with an IO Reset between. This seems to work
OK. However, I still cannot read them back without a "glitch".
I will abandon this technique, since you say it is not really proper.
I will assume it is initialized properly.

Now, I sent out the frequency update command and the 6 frequency
bytes, and pulsed the I/O UD line. I watched it all on my scope,
and it seems to go out fine. (I put it into a tight loop, triggering on
I/O UD, and then watching a sequence of data and clocks going.
Looks correct.

Now my problem is that I cannot see any output on OUT1.

Will have to keep looking to see what else is going on.

Once again, thanks for the great help, Bob.
It really was much appreciated.

> to water cooling.

The Eimac book, "Care and Feeding of Power Grid Tubes, " discusses water cooling. It is not a simple method, as extreme care is needed in maintaining the purity of the water and keeping the high voltage insulated properly.

Generally the plate of the tube must be designed for water cooling. While some experimenters removed the fins from older 2C39A/3CX100 tubes and machined their own water cooling jackets, results were often less than satisfactory. Most finned external anode tubes cannot be adequately cooled by adding a water jacket outside the fins. And there is virtually no hope of using this method with glass tubes.

In really BIG tubes, most designs have switched to vapor-phase cooling where the tube boils the water producing steam. Since the heat of vaporization can remove far more heat than a rise of twenty degrees or so of water, the method is far more efficient.

I posted something similar to the the following on rec.radio.scanner,
but apparently no hardware-oriented people read that group.

I have an old BC-210 scanner which is failing in a very "funny" way--
or it may REQUIRE the little button-battery I removed because it was so
corroded. I could just buy a new battery, but if it doesn't fix the
problem, I'll have wasted my money. So I'd like to cobble a replacement
battery, but I need to know the voltage. The manual says possible
replacements are:
Mallory 10L123
Ray-O-Vac RW48
Eveready 393

Any help?

Hi,
No, rather let the plotter use the waterproof marker. The best ink for
the purpose appears to be in a Staedler Lumocolor 313 permanent marker
pen. This is a felt tip pen, so do not expect traces smaller than
about 13 mil. For finer traces, use the ink in a plastic tipped pen.

Given the age of the scanner and the cost of the battery, I'd buy
a new battery. You can check its voltage, but it SHOULD be bad by
now.
Just glancing thru a catalog, I'm not seeing any of those
numbers. There's plenty of websites for cross referencing to find
some details on voltage and 'modern' replacements.

If you have access to QST via CD-ROM you can search for an article called, I think, "Stanley Steamer" - it was in the mid 60's -- such a linear amp was discussed.

The early 1980's Crays were also fluid cooled - you might try a search of the USPatent Office at http://www.uspto.gov and use one of their boolean search engines.

I think the German magazine VHF Communications had an article on
running the 2C29 valve (I think they had two in parallell) with water
- or rather oil - cooling. It was a construction article with all the
pumping and control devices explained. If you are interested I can
look for it in the magazines.

4454. How determine SSB PEP?

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-28 15:32:14 UTC
From: Greg Knapp <gknapp@freshrain.org>
Message-ID: <t4mna3tf44ljfc@corp.supernews.com>
Source record: 55881

I need your help. I've never had the need to calculate actual SSB PEP output before, and I have some questions.

As I do not have a "peak" reading wattmeter, but instead have an "average" reading wattmeter (the Heathkit HM-102) or the meter in the TS-940 (which I think is also just an "averaging" reading wattmeter), how can you tell your true SSB PEP output?

Do you read the meter and multiply the highest "peak" reading by some factor (2x?, 1.3X?)? But, wouldn't those factors be inaccurate and have to change if you turned on good RF speech processor, which "increases" your average (and the "average" reading on your "average" reading wattmeter), but not necessarily your peak?

Also, I am building an Oak Hills WM-2 QRP wattmeter. Do you know of any mods to it that would allow it to read peak rather than average?

Thanks in advance for any light you might shed on this.

Greg, N6GK

> Hi Bob,

The ARRL V/U projects manual deals with this I believe in a 7289 23cM amp.

I used water cooling on a 4 tube 23cM EME amp- never had a problem. I used a small radiator with a muffin fan on it to cool the water.

Every ham radio reference book published in the past 50 years
will provide many answers - and if you're serious about home-
brewing, you should invest in a couple. The ARRL and/or RSGB
Handbooks are good places to start.

There is some material made that you place in a copier like you would paper
and make a copy of the layout. Then you put the special paper on the PCB,
I think you then have to use an iron to iron it on but not sure. Read
about this method several years ago.

Hello Folks,

Staedtlers make a special etch resistant ink for writing on copper .
They sent me a complimentary bottle of it. I have not tried it but
prior to receiving it I had tried some of their waterproof inks
(spirit based) and experienced a degree of success. I am looking for a
way out of the need to use messy inks. I want a UV light pen to harden
the film which the commercial people use. This has been done in a
fashion by certain people but it has never been promoted and the price
was prohibitive. Not a sensible marketing strategy.

Load up the transmitter to maximum power output into a dummy load. Hold down the morse key when in CW mode and measure the power output. That is the peak envelope power output level. You sustained the max or peak RF envelope power long enough to measure it accurately.

Instead of CW mode you can go over to FM and measure carrier power. It will be the same as you obtained on CW with the key held down long enough to measure it.

It is the same level as the power level on the peaks when you bawl CQ into the mike when on SSB but which doesn't stay at the peaks long enough for you to measure it.

If you are not completely satisfied with the forgoing procedures, turn up the mike gain control and try to whistle into the microphone long enough to measure Tx power output. Or plug an audio oscillator into the mike socket.

It may be desribed as the maximum peak RF power which the transmitter is capable of outputting. It is the rated output power.

Billy,

FIRST, Consider just what antenna you will use.
(An offcenter feed dipole may make more sense in this application.)

Then, you should know that you will need HIGH voltage variable capacitors
and HIGH current (variable) coil(s). You want the most capacitance and
inductance
you can find to fit the general description you have provided.

Source record: 55894

Bob,

There are several approaches:

1) Vapor phase cooling - you boil water on the anode of the tube. The steam carries off the heat and you re-condense it in a radiator. In theory you have no conduction between the anode sump and the rest of the system. In practice watch out ....

2) Closed Cycle Liquid Cooling - you run water past the anode with a pump and then run it through a radiator. Corrosion of the system is a problem. The same stuff that goes into the corrosion process makes the water conductive. The stuff you use to reduce corrosion makes the water conductive. Organic coolants are expensive .....

3) Open Cycle Liquid Cooling - you run tap water past the anode of the tube and then down the drain. Unless you want 4KV on the dish washer you generally put a heat conductive insulator between the tube anode and the water stream.

A variation is to run the tube like a klystron and ground the anode. You put HV on the cathode and bias the grid way up there as well. Makes for some weird wiring, but it's better than frying the washing machine ...

In all cases you are dealing with wet stuff and high voltage - a very bad combination.

If you want to give it try look for tubes with "CV" (cooled, vapor) or "CW" (cooled, water) in the part numbers. Not all CV's and CW's are vapor or water cooled. All the vapor and water cooled stuff I have seen surplus has been a CV or CW though ...

Hope this helps ....

Bob

Source record: 55895

Craig,

Ahhhh.... now we get into the real fun. Getting an output on the beast is not easy.....

Here's what messed me up - more or less in order:

1) The stupid DAC bias resistor - at least the current data sheets show how to hook it up. I had mine in the wrong way. Preliminary data strikes .....

2) All the various enable bits - digital enable, pll enable, dac enable...

3) The frequency select word - miss the first byte and the frequency is at 1/256 th of the clock. Pretty hard to see on a scope.

Other things to check:

50 ohm to ground loads on all outputs - at least until you get an output.

Current drain, does it change when you turn the PLL on and off ? With a 60 MHz clock you should see the current on the supply change dramatically when you change the clock frequency.

The wonderful keying bits. Don't enable any of the keying stuff at first. Just run it in the CW output mode.

Why the part defaults to no output I have no idea. I wrote a Visual Basic app that let me hit the bits one at a time until I found the ones that caused the problems in my setup. It's probably worth doing something similar to allow you enough flexibility to figure the part out.

Hope this helps ....

Bob

How about using DeIonized water. Where I work we have YAG lasers that use DI water to cool the the YAG rod and the flash lamps, it also uses a small DI cartridge and a filter, granted it is not a high voltage but is a high freq. (rep rate for lamp fire) and works great unless you spring a leak.

Hope this helps some.

Reg,

Thanks for the explanation. I am not sure I can apply your answer to my specific problem. Let me explain.

I am using a TS-940 with the power level and mike gain turned down to enable QRP operation in CW and SSB modes.

With CW, it's easy, just turn down the power level until the average reading wattmeter says 5 W out. No problem.

But when I switch to SSB, where 10 W PEP is allowed for QRP, how do I know when I am running the 10 W PEP? When my average reading wattmeter reads 10 W when I whistle into the mike? I have no idea if the TS-940 in SSB mode has the same carrier/power level as when it is in the CW position, so I can't depend on that, and so all I am left with is some reading on the averaging meter, which varies depending on how close and loud I talk and whether I have the speech processor on. How can I be sure that the highest I can drive the needle on the averaging wattmeter is in fact the maximum "peak"?

This applies only for broadband transistorised amplifiers driven from
a regulated power supply, in which the PEP is the same as the
continuous output.

However, if the power supply is not regulated, the power supply output
voltage will drop much more during CW/FM than during SSB, thus
limiting the output power. In SSB, especially with the compressor
switched off, the unregulated DC voltage will remain high (close to
the peak value of the secondary of the mains transformer) and deliver
a higher PEP power than constant power.

For tube amplifiers, the PEP power can be 2 .. 4 times larger than the
rated continuous power due to the large thermal inertia of the anode,
thus the tube can be overdriven during each audio cycle.

The only way to reliably measure the PEP is to feed the transmitter
into a dummy load and monitor the voltage across the dummy load with
an oscilloscope. Use a dual tone audio signal and if not available,
say constantly 'AAAAAAAA' into the microphone. Increase the microphone
gain until the peak amplitude no longer increase and measure the peak
or peak-to-peak voltage. Square that voltage reading and divide it by
2 if this was a peak reading (or divide by 8 if this was a
peak-to-peak reading) and divide with the resistance of the dummy load
(usually 50 ohms). This is the effective RF power at the peak of the
modulating waveform, which is also the definition of PEP in ITU-R
radio regulations.

With overhead transparency material it's easy to make a positive, however photosensitive boards need a negative -- this I've done with 4*5 film. Being lazy I am looking for something even easier without wet chemistry.

For those who are interested, you can fashion a negative of sorts by using "Print Screen" to capture the image from your Layout Program, copy the screen using "Print Screen", open MS Paint or Photoshop, copy the image to Photoshop, inverting the colors and try to size it to 100%. I just find it easier to print a high res image, lay it on the scanner etc., open Photoshop, invert the image and print to an overhead transparency.

There is no way of converting average speech power (or some similar measure) to peak power. That's because the statistics of speech vary widely from one person to another, from one sex to another, from one day to another, from one mood to another.

A power meter is needed with a long time constant which 'hangs up' on peaks long enough to display the power level on peaks. One or two seconds is long enough. The meter needle should rise very fast and fall slowly. Can be done with a simple low-resistance diode to charge up a big capacitor and a high resistance to discharge it. May need a DC amplifier between the diode detector and the moving coil meter to do the job properly.

But even that is unsatisfactory to control QRP PEP to some accurately defined level. The PEP still varies according to how loud the operator bawls into the mike.

The proper way to do it is to turn up the transmitter drive and mike gain until the Automatic Level Control is FULLY operative. This will fix PEP at some repeatable and constant level regardless of who is holding the mike. It will also give a moderate and desirable amount of speech compression to improve intelligibility in a noisy background.

THEN CONNECT AN ATTENUATOR BETWEEN THE TRANSMITTER AND ANTENNA to set the required PEP level into the antenna.

It is impossible to control PEP by watching any sort of meter when talking into the mike. It is also very easy to cheat when supposedly you are on QRP.

4479. Re: Plans for a simple Antenna Tuner

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-29 12:32:36 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <92iekhkhn3@plutonium.btinternet.com>
Source record: 55755

First thing to do is experiment with one or two simple
circuits.

For starters obtain a 300pF or 400pF variable air-spaced
capacitor with a plastic knob on the drive shaft.

Several empty cardboard toilet roll or paper towel tubes.

A reel of 20 AWG or 18 AWG (1mm) enamelled copper (magnet)
wire.

Dozen alligator clips.

30 or 50 watt soldering iron.

Reel of resin-cored solder.

First coil - wind 70 turns of wire on cardboard tube,
twisting a small connecting loop into the winding every 10
or 15 turns.

Then come back to this newsgroup for further simple
instructions.

When you are familiar with how things work THEN think about
constructing a more permanent box of tricks.

You'll have lots of fun.

You take the transparency and use an iron to tranfer the pattern directly
to the board. You don't need photosensitive board with this method.

This method does work well with a little practice on some small boards
to get the iron temp, pressure, etc. right.

If you don't have a laser printer, print the pattern on regular paper
and get the transparencies made at your local copy place.

Very fine lines don't work too well with copies.

Some transparency material works better with one side than the other.

There was an outfit selling material especially for this that advertised
in one of the electronic hobby mags a while back; don't know if they
still exist.

I've made about 30 boards with this method, it works.

Has anybody designed any Tube Based Amplifiers using any of the following tubes:
7698
7815R
7855

If so, could you please post the the amount of power you have obtained at the frequency that you have used them on?

Interested in using them for EME etc...

Any info is good info at this stage, just looking for output power levels that could be expected from these...

> > with unbalance - rf wise?
> >
> > Thanks, Doug

There could be a major problem, the resistance from connecting the
one tube to the other, a 30 amp current flow at 10 volts even if
you could manage to balance the tubes you are talking of 30 amps
at 10 volts. The combined filament resistance is 1/3 of a ohm,
If you manage to keep the interconnect wiring and connectors
to 1/10 of that or 1/30 ohm (.033) an almost impossible job
without a real good junk box and some real good interconnects,
30 amps at 1/30 of an ohm will drop about a volt. the loss in that
1/30 ohms at 30 amps of current would be about 30 watts
If you could get everything perfect in a real world.
Stringing filaments in series with low power receive type tubes
is one thing, Higher power transmitter tubes is something else.
That does not include RF bypassing which would be another problem
all of it's own. Taking into account the filament current, the RF
bypassing and the drive/drive impedance you are asking for a
Major headache, A better arrangement is to use a variac in the
primary of the filament transformer and adjust
the primary to get the needed secondary voltage.

There should not be any RF on the transformer. The RF is isolated from the transformer by some chokes in the filiment circuit. That is the normal method of feeding the tubes in a groundid grid circuit.

Where did you get that 30 A from ? At least according to the ARRL
handbook, the filament is 5 V 14.5 A. Connecting two tubes in series
requires 10 V 14.5 A or connecting two tubes in parallel requires 5 V
29 A, but I do not understand how you can get 10 V and 30 A for two
tubes.

>The combined filament resistance is 1/3 of a ohm,

The single filament resistance is about 0.33 ohms, two in series would
be 0.66 ohms.

>If you manage to keep the interconnect wiring and connectors
>to 1/10 of that or 1/30 ohm (.033) an almost impossible job

That would be 0.066 ohms. However, two tubes in parallel would require
0.17 ohms, a much worse situation and as far as I know, there are
several amplifiers operating with filaments in parallel :-).

You won't have 30 amps current flow. With two 5 volt, 15 amp tube
filaments in *series* on a 10 volt 15 amp supply, the current flow is
15 amps. There could only be 30 amps flow if the filaments were
paralleled

The combined filament resistance is 1/3 of a ohm,

One always needs to use wire sizes sufficient to handle the current flow efficiently to prevent substantial voltage drop, that's a given. But all the conjecture aside, it has been done successfully, and someone said here that the Kenwood TL922 amp uses that system.I don't think they would have it it wasn't a viable system. He's trying to make use of components he already has on hand.

YOu are on teh right path. However you just can not connect things to the ground in a circuit that uses RF tubes where the filiment is also part of the circuit (used as the cathode) instead of just a heater for the cathode.

The correct way to do this is to take a rod and make 3 windings on it. YOu can use 2 heavy wires (about # 12) that go to the ends of the filiments and ends of the transformer. A smaller wire (around # 18) can be used between the CT and where the filiments are connected together. The CT wire only has to carry the unbalance in the current. If the tubes are matched exectally there would not be any current in the CT wire, but there is always a small unbalance and the CT wire corrects for this. This is mainly for the 5 volts that heat the filiments. If not used, then one tube would probably burnout first all the time.

I'm confused. Years ago the way to tune a linear to 2000W PEP was to set
the CW output to 1000W.

I am planning to stick it out with a dialup connection for the time being,
even though our lines rarely support more than 28.8K. I am just too far
from the central office. We have both cable and DSL options in my
neighborhood. I believe that our anonymous author is pretty much
right about DSL. The consensus among those I know is that cable is a
better option at the present time. It is important to run a good firewall with
either cable or DSL connections to decrease your exposure to hackers-
especially from snoopy neighbors who share the same cable connection
as you. The down side with cable: throughput drops a lot in the evenings
when everybody in the neighborhood gets on. It is a fixed amount of
bandwidth and it is shared. Very much like what happens when you are
in the shower and someone elsewhere in the house flushes a toilet. Ouch!
Unless you have very good water pressure, you notice! Cable is not perfect
but it is still better than dialup orr DSL, it appears to me.
I'm going to keep cussing my dialup service but keep it a few more
years. 73, David K3KY

I went with DSL. Dial up lines used to work at 44KB but has dropped to about 14KB in my area (probably due to all the new construction). Phone company says "too bad". They only guarentee 9600 baud data connection. My cable TV goes out every time we have a storm so I didn't want them providing Internet. I've had the DSL for about 10 months now with only one outage (when all the phones went out due to cables being cut by a construction crew).

4504. Re: Linear Amp - tube filaments in series ???

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-31 03:37:49 UTC
From: Douglas Snowden <snowden@peoplepc.com>
Message-ID: <3a4ea793@flexnet239.uunt.net>
Source record: 55781

Yes Dick, my original question was posed because I am trying
to use what I have on hand, which is actually a 10v CT xfmr.
The main thing I have gotten from the posts is that it would be
a good idea to have another small choke in the CT of the xfmr
to eliminate rf there.

Doug

Bob, What are you using this transistor for ?

Any substitute transistor will 'probably' have to have the biasing resistors changed too....

How can you renew the sheen to discolore silver plated coils, at least for certain areas of contact. Jewelry cleaner seems to be cancer related and/or you can only leave it on the silver for 10 seconds. Any better method?

Thanks.

Happy New Year!

Evan

It's normally a simple job to rewind a low voltage transformer,

The hardest part is often splitting open the laminations and removing
the insulation, without of course damaging the primary winding. The
other difficulty is obtaining the correct size winding wire. A good
place to try is an electrical repair shop if you can't reuse the
original wire which is often the case on older transformers where
insulating varnish was used.

One of the factors governing tube life is it's heater voltage, which is
often critical.

Personally I would never connect transmitting tube heaters in series,
it's impossible to ensure even balance of voltage across each heater, a
point that has already been made.

Paul

More so with indirectly heated cathodes.
>

Who cares? If the hot resistance of one tube's filament is different from the
other, they dissipate (generate) different amounts of heat regardless of how
they are connected. In parallel with constant voltage, the lower resistance one
runs hotter. In series, the higher resistance one runs hotter. Which do you
prefer?

If they are equal then there is no difference either way.

>. Years ago the way to tune a linear to 2000W PEP was to set
>the CW output to 1000W.

Years ago the US law limited you to 1KW INPUT, so you could not load the tx to 2 kw key down. So (i.e in the case of the Drake L4) you loaded the amp to 1kw at lower plate voltage and then switched to higher plate voltage and supposedly this was correct to get you 2 kw PEP. (You would only see approximately 1 kw on the plate current meter.)

BUT if you tuned to a cw output of 1kw and then you drove the amp to a higher pep output on ssb, without changing the plate voltage you were likely to be flattopping, or splattering.

4513. Re: DSL Availability In Your Area? cpJzdnId7luM

Newsgroup: rec.radio.amateur.homebrew
Date: 2000-12-31 21:36:20 UTC
From: Doug <doug@ycsi.net>
Message-ID: <92o8skvsc0@63.90.193.227>
Source record: 55790

To whomever wrote this story:

Your complaints about DSL Service are somewhat true, but the reasons behind them are fraudulent. First off, Union contracts have nothing to do with the ability of a local phone company to provide DSL service. The baby bells have been activly courting DSL customers and poviding service in the big metro areas. Unfortuanately, there is little desire on their part to

do the same in rural areas like Montana, where I live. How can you blame them when there isnt sufficient return on their investment to justify installation
of the DSL equipment in the Central offices? As a stockholder, I wouldnt want them to invest large sums of capital into an area where they wont get an adequate return for that investment. It just dosent make good business sense.

The Baby Bells are late comers to be sure in the DSL business, but have you considered one thing? In most cases, DSL service is routed over their facilities to the office or home REGARDLESS of who is the socalled "provider". Union employees are the primary backbone in circuit provision and repair. They all work under contracts that provide for adaquate coverage and callout availability for outages. Like it or not, Unions are necessary in the communications
business when dealing with large corporate entities in order to ensure rights and benefits for employees. Without them, we'd still be working for a dollar a day and 7 days a week.

Bellyaching about quality of service via the Baby Bells is both unrealistic and based on half truths propagated by so called "service providers" who for one reason or the other, find it convenient to use excuses to cover their tracks for

foulups in their own system, equipment and circuit provision.

I'm retired from USWest, after 30+ years in the business of providing data services across town or around the world. I can tell you that some of what you've heard isnt based in fact. It's become the popular culture to complain about the phone company's lack of service, without finding the real cause of the trouble.

Time to take a realistic look at the "system" today and tell the truth about who really is causing poor service in the DSL business.

From: j1aguiar@aol.com
Message-ID: <20001231163731.05382.00000294@ng-cb1.aol.com>
Source record: 55791

I am having a problem with what I think is rf getting intomy TS 950 SDX. I usually use the monitor for monitoring my cw and ssb audio. During this time it often quits and I only hear a hissing sound instead of a cw note, the same is true with ssb.
If I switch the internal antenna tuner out the problem clears up. Also I noticed that the problem is worse in the middle of the band, there again if I switch off the tuner it clears up, I have also reduced the output power which clears the problem up.
I usually operate on the lower end of the 20 meter cw band and its ok for the most part, the antenna direction also makes the problem occur more often.
Perhaps someone can share some thoughts on this or maybe even had a simular problem with the TS 950 SDX. 73'es, Jim W1OBJ

I can't imagine why you'd need it if you're taking the CT to ground. There's not going to be any RF left at the secondary centertap after it tries to get past the filament winding. That would serve quite well as an RF choke. And you've already isolated the secondary with the filament choke. I don't recall seeing an RF choke there on an amp. If you're going to meter Ip at that point you'll bypass there anyway.

Source record: 55793

I use Tarnex on a lot of transmitter parts. It cleans up silver very nicely. If you use it, it is important to flush the work piece very thoroughly with lots of hot water afterwards. I guess that is because any remaining film of this cleaner would still be chemically active. I have found that it also does a good job on ceramic. They claim that the process involves the chemical conversion of the silver oxides back into silver, i.e. it is not abrasive and is not removing anything. In practice, I have applied it mainly with Q-Tips (small cotton swabs), and have observed some grayish stain on the swab coming from the work piece. Perhaps this is just dirt and contamination and not any silver or silver compounds. You can find Tarnex in pretty much any drug store. It is in a black plastic bottle with white cap and white printing. I think I paid about 4 dollars last time I bought some. It lasts a long time. The ingredients statement lists "Acidified Thiourea, Detergent, and Corrosion Inhibitors." Cautions include wearing gloves, plus a statement that "using this product will expose you to a chemical known to the state of California to cause cancer." I use it perhaps several times a year, and I feel reasonably comfortable with it. I doubt it is anywhere near as bad as getting various volatile solvents like trichloroethylene, acetone, etc. on your skin a lot. I simply minimize skin contact, wash often, and don't worry too much about it. "Your mileage may vary." 73, David K3KY

IF you're lucky enough to find a transformer with the primary as the closest layer to the core. Most of them have it on an outer winding, forcing you to rewind both the primary and the secondary. Not impossible at all, just far more of a job to do.
I made up the filament xfmr for the 4-1000 amp I built because I had none and had the makings on hand, and the core I had did have the primary on the first layer. Winding the secondary wasn't easy, using number 6 wire. Stuff is stiff and won't form worth a darn. I used some #6 plastic insulated stuff that I had, maybe you could find some that was not so stiff. But it worked, and well.

Nothing wrong with your point except that the balance will be as good
as the manufacturers control the construction of the filaments of their
tubes of the same exact type and no better.
If there was anything seriously wrong with doing it that way I
wouldn't think that Kenwood would have used that method on the only big
amp they ever built.

One quick nitpick: According to the EIMAC catalog the C in CV & CW
stands for Ceramic, to designate a tube with ceramic insulators
instead of glass.

Other letters:
X stands for air cooled
<no letter> stands for glass insulators

So a 4X150 is a glass air-cooled tetrode, while the 4CX250 is a very
similar air-cooled tetrode with a ceramic insulator.
